Experimental details

The known complexes are generally synthesised in atmospheric conditions unless otherwise stated. The complexes were crystallized from 1,4,7-Trimethyl-1,4,7-triazacyclononane. [CrCl₃(thf)₃] was prepared by the literature method.²¹ 2,2':6',2'-terpyridyl was obtained from Sigma-Aldrich and used as received. 1,4,7-Trimethyl-1,4,7-triazacyclononane was prepared according to a previously reported method.²² Anhydrous [NMe₄]F was obtained by recrystallizing the commercial sample (Aldrich) from PrOH as described by Christe et al.²³ CH₂Cl₂ and diethyl ether were dried prior to use by distillation from CaH₂ and sodium benzophenone ketyl, respectively. Infrared spectra were recorded as Nujol mulls between CsI plates using a PerkinElmer Spectrum 100 spectrometer over the range 4000-200 cm⁻¹.¹H,¹³C,¹⁹F{¹H} and⁵⁹Co were recorded from H₂O/D₂O or MeOH/CD₂OD solutions using a Bruker AV400 spectrometer and referenced to TMS via the residual solvent resonance, CFCl₃ and [Co(CN)₆]³⁻, respectively. Microanalyses were undertaken by London Metropolitan University. UV-visible spectra were recorded in solution (H₂O or MeCN) and as powdered solids, using the diffuse reflectance attachment, in a Perkin Elmer 750S spectrometer. Magnetic measurements were made on a Johnson Matthey magnetic balance.
