**Experimental Section**

**Materials.** Ionic liquids, 1-butyl-3-methylimidazolium hexafluorophosphate ([Bmim]PF\textsubscript{6}, purity >99%), 1-butyl-3-methylimidazolium tetrafluoroborate ([Bmim]BF\textsubscript{4}, purity >99%), 1-ethyl-3-methylimidazolium tetrafluoroborate ([Emim]BF\textsubscript{4}, purity >99%), 1-benzyl-3-methylimidazolium tetrafluoroborate ([Bzmim]BF\textsubscript{4}, purity >99%), 1-benzyl-3-methylimidazolium bis(trifluoromethylsulfonyl)imide ([Bzmim]NTf\textsubscript{2}, purity >99%), 1-dodecyl-3-methylimidazolium chloride ([Domim]Cl, purity >99%) and 1-benzyl-3-methylimidazolium hexafluorophosphate ([Bzmim]PF\textsubscript{6}, purity >99%) were purchased from the Centre of Green Chemistry and Catalysis, Lanzhou Institute of Chemical Physics, Chinese Academy of Sciences. Phytic acid (70% aqueous solution), lead acetate trihydrate (purity >99%), disodium terephthalate (TPA, 99%) and SnCl\textsubscript{4}·5H\textsubscript{2}O (98%) were obtained from Sinophar Chemical Reagent Co., Ltd. Zr(NO\textsubscript{3})\textsubscript{4}·5H\textsubscript{2}O (98%) was purchased from Beijing InnoChem Science & Technology Co., Ltd. Amino tri(methylene phosphonic acid (ATMP, 50 wt% in water) was obtained from Tokyo Chemical Industry Co., Ltd. Nafion N-117 membrane (0.180 mm thick, ≥0.90 meq/g exchange capacity) were supplied by Alfa Aesar
China Co., Ltd. Nafion D-521 dispersion (5% w/w in water and 1-propanol, ≥0.92 meq/g exchange capacity) and Toray Carbon Paper (CP, TGP-H-60, 19×19 cm) were purchased from Alfa Aesar China Co., Ltd.

**Preparation of materials.** The electrode materials in this work were prepared by simple co-precipitation method. Taking the preparation of Pb-PhyA as an example: Simply, lead acetate trihydrate (0.1 g) and 1-dodecyl-3-methylimidazolium chloride (0.2 g) were dissolved in H$_2$O (17 mL). Then, phytic acid (30 µL) was added into the mixture under stirring. Immediately, precipitate was formed. This precipitate was denoted as lead phytate (Pb-PhyA). After a reaction time of 12 h, the precipitate was separated and washed with H$_2$O and ethanol, then was moved into the oven at 80 °C under vacuum for 24 h. Meanwhile, other materials with different metal ions or different ligands were synthesized using a similar route for Pb-PhyA. The difference was the amount of the used precursor: Zr(NO$_3$)$_4$·5H$_2$O (0.1 g), SnCl$_4$·5H$_2$O (0.1 g), and disodium terephthalate (TPA, 0.05 g), and amino tri(methylene phosphonic acid (ATMP, 60 µL), respectively. The characterization of these materials was presented in Figure S2-S5.

**Preparation of electrode.** The preparation process of different electrodes was similar. Taking Pb-PhyA/CP electrode as an example, 10 mg Pb-PhyA was suspended in 1 mL ethanol with 20 µL Nafion D-521 dispersion (5 wt%) to form a homogeneous emulsion assisted by ultrasound. Then, the emulsion was spread onto the CP surface by a micropipette and then dried under room temperature.
**Linear sweep voltammetry (LSV) measurement.** An electrochemical workstation (CHI 660e, Shanghai CH Instruments Co., China) was used in all the experiments. Linear sweep voltammetry (LSV) measurement was carried out in a H-type cell, which was separated by Nafion membrane with three-electrode configuration consisting of working electrode (Pb-PhyA/CP), a platinum gauze auxiliary electrode, and an Ag/Ag⁺ (0.01 M AgNO₃ in 0.1 M TBAP-MeCN) reference electrode. Prior to experiment, electrolyte was bubbled with N₂ or CO₂ for 30 min to obtain N₂ or CO₂ saturated solution. The LSV measurement in gas-saturated electrolyte was conducted in the potential range of 0 to -2.4 V vs. Ag/Ag⁺ at a sweep rate of 20 mV·s⁻¹. Slight magnetic stirring was applied in the process.

**Electrolysis of CO₂ and product analysis.** Electrolysis of CO₂ was carried out at room temperature in a typical H-type cell. IL containing solution and H₂SO₄ aqueous solution (0.5 M) were used as cathodic and anodic electrolytes, respectively. The amount of electrolyte was 20 mL in all the experiments. Prior to electrolysis, CO₂ was bubbled through the catholyte for 30 min with stirring and electrolysis was conducted under a steady follow of CO₂ (5.0 cm³·min⁻¹). The gaseous product of electrochemical experiments was analyzed by gas chromatography (GC, HP 4890D) equipped with TCD detector using helium as the internal standard. The liquid product was analyzed by ¹H NMR (Bruker Avance III 400 HD spectrometer) in DMSO-d₆ with TMS as an internal standard. The total current density and Faradaic efficiency of the products were calculated on the basis of GC and NMR analysis.
