1. General Experimental

The preparation experiments were performed under air or an argon atmosphere in oven dried glassware. Solvents used as reaction media were distilled immediately before use: THF was distilled from Na/benzophenone ketyl, DCM and DCE were distilled from calcium hydride, DMF was obtained from vacuum distillation. All reagents were purchased at the highest commercial quality and used without further purification. Reactions were monitored by thin layer chromatography (TLC) using ultra violet light (UV) as the visualizing agent. Nuclear magnetic resonance spectra (NMR) were recorded on Bruker AV-400 instruments and were calibrated using residual undeuterated solvent as an internal reference (1H NMR: CHCl₃ 7.26 ppm, 13C NMR: CHCl₃ 77.16 ppm). High resolution mass spectra (HRMS) were recorded on a hybrid IT-TOF mass spectrometer (Shimadzu LCMS-IT-TOF, Kyoto, Japan).

The following abbreviations were used to indicate multiplicities: s = singlet, d = doublet, t = triplet, q = quartet, quin = quintet, sex = sextet, sep = septet, dd = doublet of doublets, dt = doublet of triplets, ddd = doublet of doublet of doublets, ddt = doublet of doublet of triplets, m = multiplet).

2. General Procedure

General Procedure I: Oxidation of Pyridines

\[
\text{Pyridine derivative (1.0 eq.) was dissolved in DCM (0.3 M) and } m\text{CPBA (1.2 eq.) was added and stirred at room temperature overnight until the reaction was complete as indicated by TLC. The reaction mixture was concentrated in vacuo and chromatographed gradiently on silica gel with DCM/MeOH (100:1~50:1) to afford product 1.}
\]

General Procedure II:

To a solution of compound 1 (1.0 eq.) in EA (0.4 M) was added TFAA (2.5 eq.). The
resulting solution was stirred and heated to reflux for several hours (typically one to four hours) until the reaction was complete as indicated by TLC. The solution was cooled down to r.t. and concentrated in vacuo to give compound 2, which was good enough to go to the next step.

To a solution of compound 2 (1.0 eq.) in toluene (0.8 M) was added R\textsuperscript{1}-SH (1.0 eq.) and TBAB (0.2 eq.). The resulting solution was stirred and heated to reflux for several hours (typically one to five hours) until the reaction was complete as indicated by TLC. After cooled down to r.t., sat. aqueous Na\textsubscript{2}CO\textsubscript{3} were added to the reaction mixture and extracted with EA for three times. The combined organic phase was washed with brine, dried over Na\textsubscript{2}SO\textsubscript{4}, concentrated in vacuo and the crude product was purified by flash column chromatography using PE~PE/EA (50:1~1:3) to afford product 3.

4. Green Chemistry Metrics Analysis

The following formula were used for calculating Atom Economy (AE), atom efficiency (AEf), carbon efficiency (CE), reaction mass efficiency (RME), overall efficiency (OE).

\[
AE = \frac{\text{Molecular weight of product}}{\text{Total molecular weight of reactants}} \times 100
\]

\[
AEf = AE \times \text{yield\%}
\]

\[
CE = \frac{\text{Amount of carbon in the product}}{\text{Total carbon present in reactants}} \times 100
\]

\[
RME = \frac{\text{Mass of isolated product}}{\text{Total mass of reactants}} \times 100
\]

\[
OE = \frac{RME}{AE} \times 100
\]

\[
MI = \frac{\text{Total mass of input material in a process or process step}}{\text{Mass of product}}
\]

\[
PMI = \frac{\text{Total mass of input material in the whole process}}{\text{Mass of product}}
\]

\[
E \text{ Factor} = PMI - 1
\]

4.1 Process A

Step 1-2: Synthesis of 3af
Experimental procedure: See SI-13

\[ AE(3af) = \frac{343.45}{211.26 + 210.03 + 150.2} \times 100 = 60.00 \]

\[ AEF(3z) = 60 \times 80\% = 48 \]

\[ CE(3af) = 45.4 \times 18 \]

\[ RME(3af) = \frac{15.6}{12 + 29.82 + 8.53} \times 100 = 30.98 \]

\[ OE(3af) = \frac{30.98}{60} \times 100 = 51.63 \]

### 4.2 Process B

Step 1-2: Synthesis of 5a
Experimental procedure: 145 g (1.42 mol) of the acetic anhydride was added over 30 minutes to 150 g (0.71 mol) of 4-(3-methoxy propoxy)-2,3-dimethyl pyridine-N-oxide at 0°C. The solution was heated to 90°C and stirred for 6 hrs. After the completion of reaction, it was distilled under reduced pressure to remove acetic anhydride. The obtained residue containing 2-acetoxymethyl-4-(3-methoxy propoxy)-3-methyl pyridine was added in 34.2 g (0.85 mol) of sodium hydroxide & 450 ml of ethanol at room temperature. The reaction mixture was stirred at 55 °C for 2 hrs. After completion of reaction, remove ethanol by distillation under reduced pressure. The obtained residue was diluted with 1500 ml of water & extracted with methylene dichloride (500 ml × 2 & 100 ml × 1). The combined organic layer was dried over sodium sulfate. The methylene dichloride layer was concentrated to obtain 98 g (65 %) of 2-hydroxymethyl-4-(3-methoxy propoxy)-3-methyl pyridine as brown oil. (Note: the yield in the patent is 79%, which is wrong. After recalculation, it should be 65%).

Step 3: Synthesis of 6a

Chemical Reaction:

\[
\text{5a} + \text{SOCl}_2 \xrightarrow{\text{DCM}} \text{6a} + \text{SO}_2 + \text{HCl}
\]

Experimental procedure: 70 g of the 2-hydroxymethyl-4-(3-methoxy propoxy)-3-methyl pyridine obtained in example 3 was dissolved in 135 ml of methylene dichloride to obtain a solution. 73.1 g (0.61 mol) of thionyl chloride was drop wise added to this solution at 0°C. The obtained mixture was stirred at room temperature for 2 hrs. After the completion of reaction, the reaction mixture was distilled to remove the methylene dichloride & thionyl chloride under vacuum. The obtained residue was cooled to 5°C and neutralized using saturated sodium bicarbonate solution (assuming use of 450 ml) to pH-7.5 and extracted with methylene dichloride (assuming use of 400 ml). The methylene dichloride layer dried over sodium sulfate & filtered. The obtained filtrate concentrated to obtain 76 g (99.9%) of 2-chloromethyl-4-(3-methoxy propoxy)-3-methylpyridine as a brown oil.

\[
AE (6a) = \frac{229.70}{211.26 + 118.96} \times 100 = 69.56

\]

\[
OE (6a) = \frac{53.11}{69.56} \times 100 = 76.35
\]

\[

Cumulative Metrics for 6a:
Step 4: Synthesis of 3af

Experimental procedure: 11 g (0.27 mol) of sodium hydroxide was added in 350 ml of ethanol at room temperature. The mixture was stirred at 55°C for 30 minutes and cooled. 30 g (0.2 mol) of 2-mercapto benzimidazole and 50 g (0.21 mol) of 2-chloromethyl-4-(3-methoxy propoxy)-3-methylpyridine was added in above mixture. The obtained reaction mixture was stirred at 55°C for 2 hrs. After completion of the reaction, the reaction mixture was distilled to remove ethanol. 500 ml of ethyl acetate was added in residue. The ethyl acetate layer was extracted with 5 % sodium hydroxide aqueous solution (assuming use of 200 ml). The ethyl acetate layer was dried over sodium sulfate & distilled out ethyl acetate under reduced pressure. The obtained residue was dissolved in methylene dichloride (assuming use of 500 ml) & filtered the suspended particles. Distilled out the methylene dichloride, residue dissolved in 500 ml of ethyl acetate and cooled the mixture to 0°C. The
precipitated solid was filtered, wash with ethyl acetate (*assuming use of 100 ml*) and dried the product under vacuum to obtain 50.4 g (67.8%) crude title compound as an off white crystalline solid. The obtained crude compound was further purified in ethyl acetate (*assuming use of 500 ml*) to obtain pure 2-[4-(3-methoxy propoxy-3-methylpyridine-2-yl) methylthio]-1H-benzimidazole. (Note: the yield in the patent is 67.8%, which is wrong. After recalculation, it should be 73.5%).
