\section*{General Information}
All materials and catalysts were purchased from general merchant. $^1$H NMR and $^{13}$C NMR spectra were recorded at a Bruker Advance III HD spectrometer (Bremen, Germany) at 600 MHz (400 MHz) for $^1$H NMR and 150 MHz (100 MHz) for $^{13}$C NMR with CDCl$_3$ or $d_6$-DMSO as the solvent and TMS as the internal standard. High resolution mass spectra (HRMS) were measured with an Agilent 1290-6540 (Santa
Clara, USA). Low resolution mass spectra (LRMS) were recorded at an electron ionization (EI) conditions by using a Shimadzu GCMS-QP2010 Plus mass spectrometer (Kyoto, Japan). The melting points of the products were determined by an X-4 micro-melting point apparatus (Beijing, China). UV is measured by Agilent 8453 UV-visible Spectroscopy System. The average hydrodynamic size of micelles was measured by dynamic light scattering (DLS) on a Particle Size and Zeta Potential (Nanoplus-3, Micromeritics, USA), and transmission electron microscope (TEM, TECNAIG2F20-S-TWIN, FEI, USA) with a field emission gun at 200 kV. Surface tension was measured by BYZ-2 automated tensiometer (Shanghai, China) at 289.15 K.

**Typical Procedure to Synthesize L \(_1\)-L \(_4\)**

A 25 mL Schlenk flask was charged with triethylene glycol MonoMethyl ether (3 mmol, 5.0 equiv), NaH (3.6 mmol, 6.0 equiv) and DMF (3 mL). The resulting mixture was stirred at room temperature for 10 minutes until no bubbles appeared in the reaction tube. And then 2,9-dibromo-1,10-phenanthroline (0.6 mmol, 1.0 equiv) was added. Finally, the schlenk tube was heated in 110 °C oil bath for 4 h. After the reaction was finished, the reaction mixture was extracted with dichloromethane (3 × 50 mL), and then dried over anhydrous sodium sulfate and filtered. After evaporation of the solvent under vacuum, the residue was subjected to flash column chromatography on silica gel to afford products L \(_1\)-L \(_4\).

After the reaction was finished, the reaction mixture was extracted with dichloromethane (3 × 50 mL), and then dried over anhydrous sodium sulfate and filtered. After evaporation of the solvent under vacuum, the residue was subjected to flash column chromatography on silica gel to afford products 2a-2l.

**Typical Procedure for the Cross-coupling reaction of TMS-Alkynes**

A 25 mL Schlenk flask was charged with ((4-methoxyphenyl)ethynyl)trimethylsilane (61.2 mg, 0.3 mmol), 1-Phenyl-2-(triMethylsilyl)acetylene (153.9 mg, 0.9 mmol), CuI (5.7 mg, 0.03 mmol), L \(_2\) (15.1 mg, 0.03 mmol), NaOH (12.0 mg, 0.3 mmol), H\(_2\)O (2 mL), 0.3 MPa O\(_2\), and then the resulting mixture was stirred at 80 °C for 6 h. After the reaction was finished, the reaction mixture was extracted with dichloromethane (3 × 50 mL), and then dried over anhydrous sodium sulfate and filtered. After evaporation of the solvent under vacuum, the residue was subjected to flash column chromatography on silica gel to afford products 2a-p.

A 25 mL Schlenk flask was charged with ethynylbenzene (30.6 mg, 0.3 mmol), 2-methylbut-3-yn-2-ol (75.6 mg, 0.9 mmol), CuI (5.7 mg, 0.03 mmol), L₂ (15.1 mg, 0.03 mmol), H₂O (2 mL), 0.3 MPa O₂, and then the resulting mixture was stirred at 80 °C for 6 h. After the reaction was finished, the reaction mixture was extracted with dichloromethane (3 × 50 mL), and then dried over anhydrous sodium sulfate and filtered. After evaporation of the solvent under vacuum, the residue was subjected to flash column chromatography on silica gel to afford products 4a-4d.

Procedure for the circulation of the mother liquor
To a reactor (70 mL) was added 1-Phenyl-2-(triMethylsilyl)acetylene 1a (342 mg, 2 mmol), CuI (38 mg, 0.2 mmol), L₂ (100.8 mg, 0.2 mmol), NaOH (80 mg, 2 mmol), H₂O (15 mL). The reactor was charged with O₂ up to 0.3 MPa three times. Subsequently, the reactor was stirred under 0.3 MPa O₂ at 80 °C for 12 h, replenishing oxygen up to 0.3 MPa promptly if the pressure declined during the reaction period. After cooling to room temperature, the reaction mixture was filtered and washed with 0.5 mL water. The filter cake was dried and the desired product 2a was obtained, giving the yield up to 96%. The filtrate was reused directly in the next run. A fresh batch of ethynylbenzene (204 mg, 2 mmol) and NaOH (80 mg, 2 mmol) was added to the filtrate and the reaction was performed under the same reaction condition. We carried out the oxidation process successfully in 5 runs, with the yields varying as follow: 96%, 94%, 93%, 90%, 90%.

Preparation and Characterization of Micelles
UV-Vis measurement of Micelles
L₂ was formulated into an aqueous solution of 0.015 mol/L. CuI was added in a corresponding ratio. The mixed solution was stirred at room temperature for 12 h and
then diluted to $4 \times 10^{-5}$ mol/L. The measurement was carried out using water as a background solution.

**TEM measurement of Micelles**

1) TEM of pure $L_2$

$L_2$ (0.02 mmol, 10.1 mg) was dissolved in 2 mL of water and stirred at room temperature for 2 h to obtain a micelle solution. To prepare specimens for TEM observation, a drop of the micelle solution was deposited onto a carbon-coated copper grid. After deposition, excess solution was removed using a strip of filter paper. Then the carbon-coated copper grid dried in air.

2) TEM of CuI/$L_2$ (1:1)

$L_2$ (0.02 mmol, 10.1 mg) and CuI (0.02 mmol, 3.8 mg) was dissolved in 2 mL of water and stirred at room temperature for 12 h to obtain a micelle solution. To prepare specimens for TEM observation, a drop of the micelle solution was deposited onto a carbon-coated copper grid. After deposition, excess solution was removed using a strip of filter paper. Then the carbon-coated copper grid dried in air.

**Surface tension measurement of Micelles**

A micelle solution of $3 \times 10^{-2}$ mol/L $L_2$ was prepared. The solution was stirred 2 h at room temperature and then diluted to $2.5 \times 10^{-2}$ mol/L, $2 \times 10^{-2}$ mol/L, $1.5 \times 10^{-2}$ mol/L, $1.25 \times 10^{-2}$ mol/L, $1 \times 10^{-2}$ mol/L, $7.5 \times 10^{-3}$ mol/L, $6 \times 10^{-3}$ mol/L, $5 \times 10^{-3}$ mol/L, $3 \times 10^{-3}$ mol/L, $2.5 \times 10^{-3}$ mol/L, $1 \times 10^{-3}$ mol/L, $5 \times 10^{-4}$ mol/L, $2.5 \times 10^{-4}$ mol/L, $1 \times 10^{-4}$ mol/L, respectively. And then, the solutions was stirred 2 h at room temperature. The surface tensions of the solutions of micelles were determined by the Wilhelmy Plate method with an accuracy of $\pm 0.01$ mN/m. The measurements were carried out at 286.15 K with an uncertainty of 0.1 K.
