EXPERIMENTAL

Melting points were determined using a Büchi-Tottoli apparatus. 1H and 13C NMR spectra were recorded in CDCl3, DMSO-d6 and solution (unless otherwise specified) with TMS as an internal reference using a Bruker AC 300 (1H) or 75MHz (13C) instruments. Chemical shifts are given in δ parts per million (ppm) downfield from TMS. Multiplicities of 13C NMR resources were assigned by distortionless enhancement by polarization transfer (DEPT) experiments. Low-resolution mass spectra (MS) were recorded on a Perkin-Elmer Sciex API 3000 spectrometer. Column chromatography was carried out on SiO2 (silica gel 60 Merck 0.063–0.200 mm). Thin-layer chromatography (TLC) was carried out on SiO2 (silica gel 60, F 254 Merck 0.063–0.200 mm), and the spots were located with UV light. Commercial reagents were used without further purification unless stated.

**General procedure for the synthesis of compounds 5a–h, 6a–h, 9a-c and 10a-c.**

*N*-alkyl-6(5)-nitroindazoles (1.0 mmol) were added to a mixture of anhydrous SnCl2 powder (460 mg, 4.0 mmol), and acetic acid (0.572 mL, 10 mmol) in tetrahydrofuran (10 mL), followed by the addition of 2-pyrone (1.0 mmol) in THF (15 mL). The reaction mixture was stirred at 80 °C for 4 to 6 h. After the reaction was completed, the mixture was diluted with ethyl acetate (30 mL), poured into 10% NaHCO3 (30 mL), and then extracted with ethyl
acetate (50 mL x 3). The combined organic extracts were dried over MgSO₄, filtered, and concentrated. The residue was purified by column chromatography on silica gel using ethyl acetate/hexane (3:7) to afford the desired products in good yields. ¹H NMR, ¹³CNMR and DEPT copies of selected compounds are given in the supporting information.

Biology

Parasite and cell cultures. Promastigotes of the *Leishmania donovani* (MHOM/ET/67/HU3/LV9) were cultured in the dark at 26°C with 5% CO$_2$ in M199 complete medium containing M199 medium supplemented with 100 μM adenosine, 0.5 mg/L hemin, 40 mM Hepes pH 7.4 and 10% heat inactivated foetal bovine serum (HIFBS). Cultures of axenic amastigotes of *L. donovani* were obtained from late log promastigotes diluted at 1 x 10$^6$/mL in M199 complete medium acidified at pH 5.5 and cultured at 37°C with 5% CO$_2$.

Macrophage. The macrophages RAW 264.7 were cultured at 37°C with 5% CO$_2$ in DMEM complete medium containing Dulbecco's Modified Eagle's Medium (DMEM) supplemented with 100 U/mL penicillin-streptomycin, and 10% HIFBS.

Evaluation of compounds cytotoxicity. Cytotoxicity was evaluated on RAW 264.7 macrophages. Cells were plated in 96-well microplates at a density of 2 x 10$^4$ cells per well. After an incubation of 24 h at 37°C with 5% CO$_2$, the medium was removed in each well, and 100 μl of DMEM complete medium containing two fold serial dilutions of the compounds was added to each well. After 48 h of incubation at 37°C with 5% CO$_2$, 10 μl of resazurin (450 μM) was added to each well, and further incubated in the dark for 4 h at 37°C with 5% CO$_2$. Cell viability was then monitored as described above. The cytotoxicity of the compounds was expressed as CC50 (Cytotoxic Concentration 50%: concentration inhibiting the macrophages growth by 50%).

*In vitro* antileishmanial evaluation of compounds on axenic and intramacrophage amastigotes. The evaluations of activity on axenic and intramacrophage amastigotes of *L. donovani* were adapted from the protocols previously described [19]. Briefly, for the evaluation on axenic amastigotes, two fold serial dilutions of the compounds were performed in 100 μl of complete medium (see above) in 96-well microplates. Axenic amastigotes were then added to each well at a density of 10$^5$/ml in a 200 μl final volume. After 72 h of incubation at 37°C with 5% CO$_2$, 20 μl of resazurin (450 μM) was added to each well and further incubated in the dark for 24 h at 37°C with 5% CO$_2$. In living cells, resazurin is reduced in resorufin and this conversion is monitored by measuring OD570nm (resorufin) and OD600nm (resazurin; Lab systems Multiskan MS). The activity of the compounds was expressed as IC$_{50}$ in μM. Amphotericin B (AmB) was used as the reference drug.

Concerning the evaluation on intramacrophage amastigotes, RAW 264.7 macrophages were plated in 96-well microplates at a density of 2 x 104 cells per well and incubated for 24 h at
37°C with 5% CO2. Axenic amastigotes were differentiated as described above, centrifuged at 2,000 g for 10 min, resuspended in DMEM complete medium, and added to each well to reach a 16:1 parasite to macrophage ratio. After 24 h of infection at 37°C with 5% CO2, extracellular parasites were removed, and DMEM complete medium (100 μl) containing two fold serial dilutions of the compounds from a maximal concentration of 100 μM was added to each well. After 48 h of treatment, the medium was removed and replaced by Direct PCR Lysis Reagent (100 μl; Euromedex) before 3 freeze-thaw cycles at room temperature, addition of 50 μg/ml proteinase K, and a final incubation at 55°C overnight to allow cell lysis. 10 μl of each cell extract was then added to 40 μl of Direct PCR Lysis reagent containing Sybr Green I (0.05%; Invitrogen). DNA fluorescence was monitored using Mastercycler® realplex (Eppendorf). The activity of the compounds was expressed as IC₅₀ in μM. Amphotericin B (AmB) was used as the reference drug.
