1. Reaction mechanism

Scheme S1. Reaction mechanism of HMBT-LW with superoxide.
2. Experimental

2.1. Synthetic experiments: material and apparatus

All chemical reagents and solvents were purchased from commercial sources and used without further purification. Thin-layer chromatography (TLC) was performed on silica gel plates and visualized by UV. Column chromatography was performed using silica gel (Sigma-Aldrich) 200-400 mesh. $^1$H, $^{13}$C and $^{19}$F NMR spectra were recorded employing a Bruker AV-500 spectrometer with chemical shifts expressed in parts per million (CDCl$_3$, Me$_4$Si as internal standard). Electrosprayionization (ESI) mass spectrometry was performed in a Bruker MicrTOF spectrometer.

2.2. Synthetic experiments: synthetic procedures

![Reaction Scheme](image)

Scheme S2. Synthesis of target probe HMBT-LW.
2-(Benzo[d]thiazol-2-yl)-6-methoxyphenol (HMBT).

HMBT was synthesized according to literature procedures.\(^1\) A solution of 2- aminothiophenol (0.90 mL, 12.6 mmol) and \(o\)-vanilin (1.44 g, 9.45 mmol) in EtOH (30 mL), aq \(H_2O_2\) (30\%, 56.8 mmol) and aq HCl (32\% HCl, 28.35 mmol) was stirred at room temperature for 2 h. The solution was quenched by 35 mL \(H_2O\). The precipitate was filtered, dried and recrystallized from EtOH to afford the title compound as a light yellow solid (2.20 g, 68\%). M.p 158-165 \(^\circ\)C. \(^1\)H NMR (500 MHz, CDCl\(_3\)) \(\delta\) 8.02 (d, \(J = 8.1\) Hz, 1H), 7.94 – 7.87 (m, 1H), 7.52 (ddd, \(J = 8.3, 7.4, 1.2\) Hz, 1H), 7.45 – 7.39 (m, 1H), 7.35 (dd, \(J = 7.9, 1.3\) Hz, 1H), 6.99 (dt, \(J = 7.8, 3.9\) Hz, 1H), 6.94 – 6.89 (m, 1H), 3.97 (s, 3H); \(^13\)C NMR (125 MHz, CDCl\(_3\)) \(\delta\) 169.31 (s), 151.66 (s), 148.96 (s), 148.22 (s), 132.63 (s), 126.64 (s), 125.50 (s), 122.17 (s), 121.42 (s), 119.96 (s), 119.09 (s), 116.77 (s), 114.07 (s), 56.22 (s). HRMS (ES\(^+\)): calc. for \(C_{14}H_{11}NO_2S\) [M+Na]\(^+\) 280.0403, found 280.0435.

2-(Benzo[d]thiazol-2-yl)-6-methoxyphenyl trifluoromethanesulfonate (HMBT-LW).

To a solution of HMBT (77.1 mg, 0.3 mmol) in dry \(CH_2Cl_2\) (10 mL) at -78 \(^\circ\)C was added trifluoromethanesulfonic anhydride (240 \(\mu\)L) dropwise under an argon atmosphere. The resulting mixture was stirred at -78 \(^\circ\)C for 10 min and then triethylamine (150 \(\mu\)L) was added to the solution and stirred for 30 min at room temperature. The solvent was removed under vacuum and the residues were purified through silica column chromatography to obtain HMBT-LW as a pale-yellow solid. M.p 77-80 \(^\circ\)C. \(^1\)H NMR (500 MHz, CDCl\(_3\)) \(\delta\) 8.16 (d, \(J = 8.1\) Hz, 1H), 7.94 (d, \(J = 8.4\) Hz, 1H), 7.57 – 7.50 (m, 2H), 7.47 – 7.40 (m, 2H), 7.16 (dd, \(J = 8.3, 1.5\) Hz, 1H), 3.97 (s, 3H). \(^13\)C NMR (125 MHz, CDCl\(_3\)) \(\delta\) 161.62 (s), 153.58 (s), 152.29 (s), 136.25 (s), 135.59 (s), 128.86 (s), 128.51 (s), 126.53 (s), 125.81 (s), 123.90 (s), 122.87 (s), 122.27 (s), 121.45 (s), 119.72 (s), 117.17 (s), 114.70 (s), 114.62 (s), 56.47 (s). \(^19\)F NMR (470 MHz, CDCl\(_3\)) \(\delta\) -73.72 (s).
3. Generation of various ROS

\( \text{ROO}^\bullet \)
ROO\(^\bullet\) was generated from 2,2’-azobis (2-amidinopropane) dihydrochloride. AAPH (2, 2’ azobis (2-amidinopropane) dihydrochloride, 1 M) was added into deionizer water, and then stirred at 37 °C for 30 min.

\( \text{•O}_2^- \)
Superoxide was generated from KO\(_2\). KO\(_2\) and 18-crown-6 ether was dissolved in DMSO to afford a KO\(_2\) stock solution.

\( \text{•HO} \)
Hydroxyl radical was generated by the Fenton reaction. To prepare \( \text{•OH} \) solution, hydrogen peroxide (H\(_2\)O\(_2\), 10 eq) was added to Fe(ClO\(_4\))\(_2\) in deionised water.

\(^1\text{O}_2\)
NaMoO\(_4\) (20 mM) and H\(_2\)O\(_2\) (20 mM) were prepared in deionized water. Equal aliquots of these two solutions were then mixed to yield \(^1\text{O}_2\) of 10 mM.

\( \text{ONOO}^- \)
Simultaneously, 0.6 M KNO\(_2\), 0.6 M in HCl, 0.7 M in H\(_2\)O\(_2\) was added at to a 3 M NaOH solution at 0 °C. The concentration of peroxynitrite was estimated by using extinction coefficient of 1670 cm\(^{-1}\) M\(^{-1}\) at 302 nm in 0.5 M sodium hydroxide aqueous solutions.

\( \text{•OCl} \)
The concentration of \( \text{OCl} \) was determined from the absorption at 292 nm (\( E = 350 \text{ M}^{-1} \text{ cm}^{-1} \)).

\( \text{H}_2\text{O}_2 \)
The concentration of H\(_2\)O\(_2\) was determined from the absorption at 240 nm (\( E = 43.6 \text{ M}^{-1} \text{ cm}^{-1} \)).
4. UV-Vis and fluorescence analysis of HMBT-LW

**HMBT-LW** was made into a 5 mM stock solution in anhydrous DMSO. Superoxide anion was prepared by dissolving KO$_2$ in DMSO with the help of 18-crown-6. In titration experiments, different volumes of KO$_2$ diluents were added to DMSO (1.5 mL) containing 3 μl of **HMBT-LW** stock solution, and the corresponding volumes were made up to 3 ml in cuvette.

The fluorescence quantum yield was determined on an Absolute PL Quantum Yield Spectrometer (HAMAMATSU C11347). The PL Quantum Yield ($\Phi$) determined is expressed as the ratio of the number of photons emitted from molecules ($P_{\text{em}}$) to that absorbed by molecules ($P_{\text{abs}}$).

$$\Phi = \frac{P_{\text{em}}}{P_{\text{abs}}}$$

The fluorescence quantum yield of 2-(2'-hydroxy-3'-methoxyphenyl)benzothiazole (**HMBT**) 5 μM was 0.508 in PBS buffer solution (10 mM, V/V, DMSO/PBS = 1/1, pH = 7.4).

![Figure S1. UV spectra of HMBT-LW (5 μM), with (42 equiv.) and without O$_2^{-}$ in PBS buffer solution (10 mM, V/V, DMSO/PBS = 1/1, pH = 7.4).](image)
Figure S2. A plot of fluorescence intensity ratio changes (based on the peak heights at the maxima, 378 and 483 nm respectively) depending on O$_2^{-}$ concentration. HMBT-LW (5 µM) in PBS buffer solution (10 mM, V/V, DMSO/PBS = 1/1, pH = 7.4). Error bar represents s.d. $\lambda_{ex} = 310$ nm. Slit widths: ex = 8 nm, em = 5 nm.

Figure S3. pH effect on the fluorescence intensity of HMBT-LW (5 µM) at 378 nm (in black) and 483 nm (in red) in solution (V/V, DMSO/water = 1/1). $\lambda_{ex} = 310$ nm. Slit widths: ex = 8 nm, em = 5 nm.
Figure S4. Fluorescence intensity versus concentration of $\text{O}_2^{-}$ for the calculation of the limit of detection for HMBT-LW (5 $\mu$M) in PBS buffer solution (10 mM, V/V, DMSO/PBS = 1/1, pH = 7.4) at 25 $^\circ$C. Fluorescence intensities were measured with $\lambda_{\text{ex}} = 310$ nm. Error bar represents s.d. The LOD is 7.4 $\mu$M. Slit widths: $\text{ex} = 8$ nm, $\text{em} = 5$ nm.
Figure S5. Time-dependent fluorescence ratio changes of HMBT-LW (5 µM) towards 39 equiv. of superoxide anion in PBS buffer solution (10 mM, V/V, DMSO/PBS = 1/1, pH = 7.4) at 25 °C. λ_{ex} = 310 nm. Slit widths: ex = 8 nm, em = 5 nm.
