I. Experimental procedures

**General Sonogashira cross-coupling procedure.** A two-neck round-bottomed flask equipped with a septum and a nitrogen valve containing previously degassed Et$_3$N (and THF if necessary) is charged with [(C$_6$H$_5$)$_3$P]$_2$PdCl$_2$ (5% mol), CuI (1.5% mol) and the aryl halide under nitrogen. The mixture is heated at 60-70 ºC for 15 min and then, the acetylene dissolved in degassed Et$_3$N is added via cannula and stirred vigorously for 16 hours. The mixture is filtered to eliminate the ammonium salt, washed with THF and later the solvent is evaporated. The crude product is ready for the next purification step.

**General procedure for the desilylation:** In a round bottomed flask charged with the (trimethylsilyl)ethynyl compound, THF and two drops of water is added TBAF (~0.5 equivalents per silyl group, 1M solution in THF). The mixture is stirred for 3 min and then the reaction is stopped by passing it thought a plug of silica gel. After the THF evaporation, the product is dried in vacuum for two hours and then used without further purification.

**General procedure for the esterification of carboxylic acids.** In a round bottomed flask, a mixture containing the carboxylic acid, 1-bromododecane, DBU and toluene is refluxed overnight. After filtering the precipitated DBU-salt, the solvent is evaporated in vacuum and the crude product is ready for the next purification step.

**Synthesis of (dodecyl) 3-iodobenzoate (4).** Applying the general procedure for the Sonogashira cross-coupling: 1 (500 mg, 0.49 mL, 2.01 mmol), 1-bromododecane (500 mg, 2.21 mmol) and DBU (330 mg, 2.21 mmol) in toluene (20 mL) are reacted. After filtering the DBU salt, the solvent is removed in vacuum. The crude product is purified by Silica gel chromatography (CH$_2$Cl$_2$) to obtain white crystals in 89% yield. m.p. 27-30 ºC. $^1$H NMR (CDCl$_3$, 500 MHz,) δ (ppm): 8.36 (t, 1H, J=1.5 Hz, -PhH), 8.0 (dt, 1H, J=8.0, 1.5 Hz, -PhH), 7.87 (dt, 1H, J=8.0, 1.5 Hz, -PhH), 7.17 (t, 1H, J=8 Hz, -PhH), 4.30 (t, 2H, J=7 Hz, COO-CH$_2$), 1.76 (q, 2H, J=7 Hz, -CH$_2$-β-O), 1.44-1.41 (m, 2H, -CH$_2$-γ-O), 1.25-1.39 (m, 16H, -CH$_2$), 0.88 (t, 3H, J=6.5 Hz, -CH$_3$); $^{13}$C NMR (CDCl$_3$, 125 MHz) δ (ppm): 165.10 (-COO), 141.65 (-PhC), 138.48 (-PhC), 132.51 (-PhC), 130.03 (-PhC), 128.76 (-PhC), 93.87 (-PhC), 65.60 (C-α-O), 32.0 (C-β-O), 29.72-28.75 (-CH$_2$), 26.08 (C-γ-O), 22.77 (-CH$_2$-CH$_3$), 14.21 (-CH$_3$).
