Chemistry

General procedures.

All organic solvents were purchased from commercial sources and used as received or dried using standard procedures; all chemicals were purchased from Aldrich, Merck or Alfa Aesar and used without further purification.

Analytical thin layer-chromatographies (TLC) have been performed on pre-coated silica gel plates (Kieselgel 60 F254, E. Merck, Germany), and chromatograms were visualized by UV-light irradiation (254 and 360 nm), then by staining with ninhydrin, p-anisaldehyde or H2SO4/EtOH. Purifications by column chromatography have been performed using silica gel, 100-200 mesh (Merck, Germany).

NMR spectroscopies were recorded in dry deuterated solvent (DMSO or chloroform) on a Bruker AC 200, or on a Bruker AC 500 spectrometers at 200 MHz or 400 MHz for 1H NMR and 50 MHz for 13C NMR; δ is expressed in ppm related to TMS (0 ppm) as internal standard. Splitting patterns are designated as follow: s (singlet), d (doublet), t (triplet), m (multiplet), br (broad). Coupling constants (J values) are listed in Hertz (Hz). Mass spectra (ESI-MS) were recorded on a Bruker Daltonics Esquire 3000+, and the samples were diluted in methanol.

General procedure for the Friedel-Craft ribosylation.

To a stirred solution of the carbohydrate (1’-β-ribofuranose-1’,2’,3’,5’-tetraacetate, 1 mmol) and the appropriate (hetero)aryle (2 mmol) in dichloromethane (8 mL), was added at room temperature and in one portion FeCl3 (10 mol%). The resulting mixture is heated in refluxing dichloromethane and the reaction is monitored by TLC. Once the carbohydrate fully reacted (10-30 min.), 10 mL of a saturated solution of NaHCO3 was added to quench the reaction. The mixture is extracted three times using dichloromethane (15 mL). The organic layers were combined, then dried over MgSO4 and concentrated under reduced pressure; the crude material is purified by flash chromatography using a mixture of ethyl acetate and hexane as solvent. Importantly, samples used for the fluorescence assay have been submitted to a second purification (preparative TLC) is order to strengthen their final purities.

Photophysics

*General procedures.*

All solvents for absorption and fluorescence experiments were of spectroscopic grade. Absorption spectra were recorded on a Cary 4 spectrophotometer (Varian) using quartz cells of 1 cm path length. Fluorescence spectra were recorded on FluoroMax 4.0 spectrofluorometer (Jobin Yvon, Horiba). Wavelengths used as the excitation wavelengths are highlighted in table 3. Stock solutions of the solvatofluorochromic dyes were prepared using 1,4- doxane. The samples used for spectroscopic measurements contained $\approx 0.1\% \text{ v/v}$ of the stock solvent. For fluorescence quantum yield measurements, the absorbance of the corresponding solution was kept below 0.05.
