1. General experiment

All commercially available reagents and solvent were obtained from the commercial providers and used without further purification. Nuclear Magnetic Resonance spectra were recorded on Bruker Avance 300 and Bruker ARX 400 spectrometers. All $^1$H NMR experiments were reported in $\delta$ units, parts per million (ppm), and were measured relative to residual chloroform (7.26 ppm) or DMSO (2.5 ppm) in the deuterated solvent. All $^{13}$C NMR spectra were reported in ppm relative to DMSO-d$_6$ (39.9 ppm), CD$_3$OD (48.0 ppm) and all were obtained with $^1$H decoupling. Data for $^1$H NMR are recorded as follows: chemical shift ($\delta$, ppm), multiplicity ($s =$ singlet, $d =$ doublet, $t =$ triplet, $q =$ quartet, $m =$ multiplet or unresolved, br = broad singlet, coupling constant(s) in Hz, integration). Data for $^{13}$C NMR are reported in terms of chemical shift ($\delta$, ppm). Electron impact (EI) mass spectra were recorded on AMD 402 mass spectrometer (70 eV). High resolution mass spectra (HR-MS) were recorded on Agilent 6210. The data were given as mass units per charge (m/z). Gas chromatography analysis was performed on an Agilent HP-5890 instrument with a FID detector and HP-5 capillary column (polydimethylsiloxane with 5% phenyl groups, 30 m, 0.32 mm i.d., 0.25 $\mu$m film thickness) using argon as carrier gas. The products were isolated from the reaction mixture by column chromatography on silica gel 60, 0.063-0.2 mm, 70-230 mesh (Merck). To detect CO gas we used Micro III CO sensor device (0-500 ppm) which was produce by GFG Company. 300 mL Autoclave of the 4560 series was ordered from Parr Instruments®.

2. General procedure

In a 25 mL tube, a mixture of indoles 1 (0.2 mmol, 1 equiv.), glyoxylic acid monohydrate 2a (0.4 mmol, 2 equiv.), Ni(OAc)$_2$·4H$_2$O (0.02 mmol, 10 mol%), FeCl$_3$ (0.08 mmol, 40 mol%), Ag$_2$CO$_3$ (0.4 mmol, 2 equiv.), Cu(OAc)$_2$ (0.2 mmol, 1 equiv.), and NaOAc (0.4 mmol, 2 equiv.) in DMSO (1 mL) were added under air atmosphere, then the tube was sealed and stirred at 130 °C for 15 hours. Then the mixture was cooled to room temperature. The residue was diluted with H$_2$O solution (10 mL) and extracted with EtOAc (3×10 mL). The solvent was then evaporated under vacuum. The crude products were purified by using column chromatography on silica gel (pentane/ethyl acetate) to give the pure products.
