EXPERIMENTAL DETAILS

All reactions were performed with oven dried laboratory glassware, under nitrogen atmosphere unless otherwise indicated. Anhydrous solvents were purchased in sealed bottles provided with crown cap from Sigma Aldrich, Acros Organics and Alfa Aesar. All reactants used were purchased from Sigma Aldrich, Fluorochem and TCI and used as received without any further purification.

Reactions were monitored with thin-layer chromatography (TLC) using TLCs ALUGRAM® Xtra SIL G/UV254 (0.2 mm thin layer depth; Macherey-Nagel). Spots visualization was performed with UV lamp (365 nm and/or 254 nm respectively). Gravimetric chromatography columns were performed using silica gel (particles diameter: 0.63-2.00 mm) as stationary phase.

$^1$H-NMR spectra were recorded with Bruker AVANCE instrument operating at 400.13 MHz. Chemical shifts are reported in ppm (δ) and to describe spin multiplicity, some abbreviations were used: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br = broad signal, dd = doublet of doublets, td = triplet of doublets, dt = doublet of triplets. Coupling constants are reported in Hz. $^{13}$C-NMR spectra were recorded with Bruker AVANCE instrument operating at 100.56 MHz, with total proton decoupling. Chemical shifts are reported in ppm (δ). High-resolution mass spectra (HRMS) were recorded using an Electrospray Ionisation (ESI) spectrometer. GC-MS analyses were performed with a Finnigan Trace GC-MS equipped with a quadrupole analyzer and electronic impact source. Other masses were obtained by VG 7070 EQ mass spectrometer with CI (Chemical Ionization). IR spectra were recorded with a FT-IR Thermo Scientific Nicolet iS10 Smart iTR equipped with a Smart OMNI Transmission instrument, interfaced with a Omnic 9.2.98 software; some spectra were recorded with ATR technique, other ones with a KBr disk. Melting points were obtained with a Stuart Melting Point SMP30 instrument.

**Compound 42.** (E)-1-hydroxy-3-(3-(2-nitrophenyl)acryloyl)-1H-indole-5-carbonitrile (102 mg, 0.31 mmol) was dissolved in a solution of MeOH (6 ml) and 1,4-dioxane (2 ml) under nitrogen atmosphere. A saturated solution of NH\(_4\)Cl (15 ml) and In powder (175 mg, 1.53 mmol) were added to the solution. The mixture was refluxed for 12 hours, cooled to rt and filtered over silica gel (MeOH). The crude residue was purified by flash chromatography (toluene-EtOAc 7:3) and 3-(quinoline2-yl)-1H-indole-5-carbonitrile 42 was obtained

**Compound 43 (JWH-018).** A mixture of 1-hydroxy-3-(1-naphthoyl)-1$H$-indole (211 mg, 0.73 mmol), $n$-pentyl bromide (293 mg, 1.94 mmol), KOH (108.6 mg, 1.94 mmol) is stirred at r.t. for 12 hours. Solvent is removed in vacuo and the crude product is diluted in DCM and washed with aqueous NaOH 5%. Recombined organic phases are dried with MgSO$_4$, filtered and solvent removed under reduced pressure. Crude product is then purified by gravimetric chromatography (hexane : DCM 4:6) to afford 43 as a brown solid (53 mg, 20% yield). Spectroscopic data for this compound are in agreement with the ones reported in literature.36

PLANETARY BALL MILL

20 mg (0.187 mmol) of nitrosobenzene 1c and 24.3 mg (0.187 mmol) of 1-phenyl-2-propyn-1-one 2a were placed inside a grinding jar with 40 balls (4 mmø). The grinding duration was 2 hours at a speed of 450 rpm; every 5 minutes the direction of rotation was reversed for greater homogeneity of the sample and avoid excessive raising of the temperature. The estimated temperature (around 45-55 °C) was not monitored. At the end of the treatment a sample was taken and by the GC-MS analysis the presence of the two starting reagents, 12% of the product 14 and the related azo derivative 44 in traces as a by-product were observed.

MICROWAVE

20 mg (0.187 mmol) of nitrosobenzene 1c and 24.3 mg (0.187 mmol) of 1-phenyl-2-propyn-1-one 2a were placed inside a flask and irradiated in MW with a fixed power of 50W for 2 hours. The program followed was 5 minutes of treatment followed by a minute break until reaching an effective reaction time of 2 hours. Every 40 minutes a withdrawal has been made; after 2 hours (data obtained via GC-MS) 62% of indole product 14, 7% of azo derivative 44, 12% of nitrosobenzene and 19% of arylalkynone were afforded.
