Main materials and measurements

1,3,5-Benzene-tricarbonyl trichloride was purchased from Sigma-Aldrich Chemicals. Indole was purchased from J & K Technology Co., Ltd., and was purified by recrystallization from alcohol twice before use. The rest of the materials and reagents were obtained from different commercial sources and used without purification.

FT-IR spectra were recorded on a Nicolet 6700 FTIR spectrometer. $^1$H NMR and $^{13}$C NMR spectra were recorded using Bruker AMX600 MHz NMR spectrometers in DMSO-d$_6$. Solidstate cross-polarization magic-angle-spinning (CP/MAS) NMR spectra were recorded on a Bruker Avance III 400 NMR spectrometer. The elemental analysis characterization technique was performed using a Vario EL III apparatus. Mass spectra were recorded with a Microflex LRF MALDI-TOF mass spectrometer. Thermogravimetric analysis (TGA) was performed on a Setarma TG-92 at a heating rate of 10 °C min$^{-1}$ under a nitrogen atmosphere. The scanning electron microscopy (SEM) image was recorded on an S-4800 (Hitachi Ltd) field emission scanning electron microscope. Morphological observation was performed with a Tecnai G2 F20 S-TWIN (FEI Company) transmission electron microscope. Gas adsorption isotherms were measured by a volumetric method using a Quantachrome NOVA 3000. The samples were degassed for 10 hours at 120 °C, and the obtained adsorption-desorption
isotherms were evaluated to obtain the pore parameters, including Brunauer-Emmett-Teller (BET) specific surface area, pore size, and pore volume. The pore size distribution (PSD) was calculated from the adsorption branch using the nonlocal density functional theory (NLDFT) approach. The selectivity of the prepared P kin to separate CO₂ from CO₂/N₂/CH₄ mixtures was estimated by the ratio between the CO₂, N₂ and CH₄ adsorption capacities at a selected pressure. The Clausius-Clapeyron equation was employed to calculate the enthalpies of adsorption for CO₂ on the networks. In each case, the data were fit using the equation: (\ln P)ₙ = -(Qₜₐₛ/R)(1/T) + C, where P is the pressure, n is the amount adsorbed, T is the temperature, R is the universal gas constant and C is a constant. The isosteric heat of adsorption Qₜₐₛ was subsequently obtained from the slope of plots of (\ln P)ₙ as a function of 1/T. The simulation method was presented in Supporting Information.

**Synthesis and characterizations of KIN**

To a solution of indole (363 mg, 3.1 mmol) in anhyd DCE (3.5 mL) taken in a round-bottom flask at 0 °C under nitrogen was added 1,3,5-Benzenetricarbonyl trichloride (265 mg, 1 mmol) in anhyd DCE (1.5 mL) by a syring under nitrogen. Zirconium tetrachloride (1049 mg, 4.5 mmol) was added under a flow of nitrogen. The reaction temperature was then
gradually increased to 20 °C, and the reaction was continued at 20 °C. After completion of the reaction as indicated by TLC (4 h), the resultant mixture was quenched with water (10 mL) and extracted with EtOAc (3×30 mL). The combined organic layer was washed with water (2×10 mL), dried with anhyd Na₂SO₄, and concentrated under vacuum. The column chromatographic purification of crude mass on silica gel eluting with EtOAc-DCM provided light yellow powders (294mg, 58% yield). MS (ESI): m/z = 506 [M]+; Anal. Calcd for C₃₃H₂₁N₃O₃: C, 78.09; H, 4.17; N, 8.28; Found: C, 78.07; H, 4.15; N, 8.29. FT-IR spectrum (KBr pellet, cm⁻¹): 1607, 1428, 1177, 751, 635; ¹H NMR (400 MHz, DMSO-d₆): δ=12.01 (s, 3H), 8.29 (s, 6H), 8.10(s, 3H), 7.50(d, 3H), 7.25(s, 6H); ¹³C NMR (100 MHz, DMSO-d₆): δ =189.17, 141.20, 137.26, 136.76, 130.79, 126.63, 123.76, 122.56, 121.92, 115.30, 112.83 ppm.

Preparation of the PKIN

KIN (506mg, 1mmol) was dispersed in 50 mL of DCE under the nitrogen environment. To this solution, we added iron(III) chloride (1.407 mg, 8.7 mmol), and the mixture was stirred at room temperature for 24 h. The resulting mixture was transferred to 150 mL of methanol. The precipitates were collected by filtration and washed with methanol, dilute HCl, distilled water, and methanol, sequentially. After washing, the precipitates were collected and dried under vacuum at 60 °C for 36 h. Yield = 93%.
Additionally, the PKIN was also characterized by a FTIR spectrometer and $^{13}$C CP/MAS NMR spectrometer, and the satisfactory results were in good agreement with the proposed structures (Fig. S3). Furthermore, in order to further understand the structure of the resulting material, the elemental analysis was also investigated, and the result was listed as follows: Anal. Calcd for C$_{33}$H$_{18}$N$_{3}$O$_{3}$: C, 78.50; H, 3.57; N, 8.38; Found: C, 77.88; H, 3.61; N, 8.27.

Fully optimized geometries of model compound-CO$_2$ interactions

![Fully optimized geometries of model compound-CO$_2$ interactions](image)

Figure S9. Fully optimized geometries of model compound-CO$_2$ interactions calculated using density functional theory (DFT).
Simulation method

To illustrate the molecular mechanism, we used density functional theory (DFT)\(^4,5\) to investigate the interaction of indole, carbonyl with CO\(_2\) and to track the CO\(_2\) capture process. They were calculated at the M06-2X level with the aug-cc-pVDZ basis set and the resolution-of-identity spin-component-scaling Möller-Plesset second-order perturbation theory (RI-scs-MP2) level with the aug-cc-pVTZ basis set.\(^6,7,8\) The geometries were fully optimized without symmetry constraints at each calculation level. The M06-2X functional (hybrid-meta GGA with dispersion correction) has shown good performance in the investigation of the dispersion interaction as well as the electrostatic interaction (H-bonding, H-π interaction, π-...
\[ \pi \] interaction, additional electrostatic and induction energies of neutral and charged dimeric systems\textsuperscript{9,10} Single point calculations using the RI-coupled cluster theory with single, double and perturbative triple excitations (RI-CCSD(T)) were performed by employing the aVTZ and aug-cc-pVQZ (aVQZ) basis sets at the RI-scs-MP2/aVTZ geometries. The CO$_2$-BEs were calculated at the complete basis set (CBS) limit at the RI-CCSD(T) level with the aVTZ and aVQZ basis sets by employing the extrapolation approximation\textsuperscript{11,12} The complete basis set energies were estimated with the extrapolation scheme utilizing the electron correlation error proportional to N\textsuperscript{-3} for the aug-cc-pVNZ basis set (N=3:T, N=4:Q). It is generally known that the zero-point-energy (ZPE)-uncorrected BE(-\Delta E_e) is closer to the experimental CO$_2$-adsorption enthalpy (\Delta H_{ads}) than the ZPE-corrected BE(-\Delta E_0).\textsuperscript{3,13,14} Therefore, the values of -\Delta E_e are reported as the CO$_2$-BEs.
