1. Materials and Instrumentation

All solvents and reagents were obtained from commercial sources at the highest purity available and used without further purification. The list of suppliers includes SIGMAALDRICH (Sigma-Aldrich Chemie GmbH, Steinheim, Germany), ACROS ORGANICS (Thermo Fisher Scientific GmbH, Geel, Belgium), MERCK KGaA (Merck KGaA, Darmstadt, Germany), ALFA Aesar (Thermo Fisher Scientific GmbH, Kandel, Germany), CARBOLUTION CHEMICALS (Carbolution Chemicals GmbH, Saarbrücken, Germany), IRIS BIOTECH (Iris Biotech GmbH, Marktredwitz, Germany), TOKYO CHEMICAL INDUSTRY (TCI Deutschland GmbH, Eschborn, Germany) and ABCR (abcr GmbH, Karlsruhe, Germany). Water was demineralized prior to use. Solvents used for air or moisture sensitive reactions were purchased anhydrous or dried prior to use according to common drying techniques. Purification via preparative flash column chromatography (FC) was carried out using silica gel with an average grain size of 15-40 µm (MERCK). Technical grade solvents that were used as a mobile phase were distilled before use. Analysis of the collected fractions was performed via TLC on silica coated aluminum sheets (60 Å F254, MACHEREY-NAGEL). Solvents which were needed for flash chromatography (FC) were purchased in technical quality and used without further purification. The solid phase peptide synthesis (SPPS) was carried out on a Peptide Synthesizer CS 136XT (CS Bio) using 2-chloro-tritylchloride resin (1.6 mmol/ g loading) and SPPS-grade reagents and solvents.

NMR-spectroscopy
NMR-spectra were recorded on a BRUKER ARX 300 spectrometer, BRUKER Avance II 400 and BRUKER Avance III 600 spectrometer. All measurements were carried out in deuterated solvents. The chemical shift (δ) is recorded in parts per million (ppm) and relative to the residual solvent protons. The measured coupling constants were calculated in Hertz (Hz). To analyse the spectra the software MESTRENOVA 10.0.1 was used. The signals were quoted as follows: s = singlet, bs = broad singlet, d = doublet, t = triplet, q = quartet and m = multiplet.

Mass-spectrometry
High resolution electrospray ionization mass spectra (ESI-HRMS) were recorded on a Micromass QToF Ultima 3 (WATERS) performed by the mass-spectrometric department of the Institute of Organic Chemistry, Johannes Gutenberg-University Mainz. Molecules of a high molecular mass were detected using matrix assisted laser desorption ionization-time of flight (MALDITOF) spectrometry using a Schimadzu Axima CFR.

Transmission electron microscopy (TEM)
Negative stain EM: grid preparation and image recording in brief: 5 µL sample droplets were adsorbed for 2 min on freshly glow-discharged copper grids (Electron Microscopy Sciences; CF300-CU) covered by a thin, continuous carbon film. The grids
were then negatively stained with 2.0% uranyl acetate (Polysciences) for 1 min before blotting with filter papers (Whatman no. 4). All images were recorded with a FEI Tecnai T12 electron microscope equipped with a LaB₆-cathode and operated at 120 kV. Digital electron micrographs were recorded with a 4k x 4k CMOS camera (TVIPS) under minimal dose conditions.

**Photoluminescence lifetime measurements**

Time-resolved photoluminescence measurements were performed with a Fluorolog3 spectrofluorometer equipped with a FluoroHub TCSPC (time-correlated single photon counting) unit (Horiba Jobin Yvon). As excitation source a pulsed NanoLED-370 with an emission wavelength of 370 nm, a repetition rate of 1 MHz and a pulse width of 1.2 ns was used (Horiba Jobin Yvon). The concentration of each sample was adjusted to keep the absorbance at the excitation wavelength $\lambda_{\text{exc}} = 370$ nm below values of 0.1, in order to avoid artefacts from the inner-filter effect. The photon arrival times with respect to the excitation pulse were collected in fluorescence decay histograms with a channel width of 13.6 ps, 119.4 ps and 5.9 ns. The overall timing resolution of the setup was quantified by the FWHM (full width at half maximum) IRF (instrumental response function) to 1.5 ns, measured at 370 nm with a scattering solution. Data analysis was performed with home-written software in Python utilizing a deconvolution fit according to the following equation:

$$I_{fl}(t) = \left[ \sum_n a_n \exp \left( -\frac{t}{\tau_n} \right) \right] \otimes irf(t) + b$$

(S1)

Using amplitudes $a_n$ and lifetimes $\tau_n$ of a given decay, the intensity weighted average fluorescence lifetime $\langle \tau \rangle$ can be calculated by the following equation:

$$\langle \tau \rangle = \frac{\sum_n a_n \tau_n^2}{\sum_m a_m \tau_m}$$

(S2)
2. Additional Data

UV/Vis Absorption spectra

Figure S1: Absorption spectra of amphiphiles I (black line) and IV (green line) in 10 mM phosphate buffer (pH 7.4); monomer concentrations: 37.5 µM.

Figure S2: Absorption spectra of amphiphiles II (black line) and V (blue line) in 10 mM phosphate buffer (pH 7.4); monomer concentrations: 12.5 µM.
Figure S3: Absorption spectra of amphiphiles III (black line) and VI (red line) in 10 mM phosphate buffer (pH 7.4); monomer concentrations: 9.375 µM.

Photoluminescence lifetime data

The results for the time-resolved photoluminescence measurements are summarized in table T1. The decay curves for I-V were fitted with a sum of two exponential functions. The decay curve for VI was fitted by a three-exponential function, whereby the lifetimes from the fit of III were used and kept constant.

Table T1: Result of the fits of fluorescence decay curves and calculated intensity weighted average lifetimes ($\langle \tau \rangle$ ns for peptide amphiphiles I-VI.

The self-diffusion$^{2,3}$ of HDO in D$_2$O (1.9 $10^{-9}$ m²·s⁻¹), and DMSO-$d_6$ in DMSO-$d_6$ (6.6 $10^{-10}$ m²·s⁻¹) were used to calibrate the measurements.

The model used to calculate the hydrodynamic radii of the molecules is the Stokes–Einstein relation$^4,5$ for the diffusion of a spherical particle:

$$D = \frac{kT}{6\pi\eta R_H} \text{ / m}^2\text{·s}^{-1}$$

$k$ = Boltzmann constant = 1.38065 $10^{-23}$ m²·kg·s⁻²·K⁻¹
$T$ = absolute temperature / K
$\eta$ = dynamic viscosity / kg·m⁻¹·s⁻¹
$R_H$ = hydrodynamic radius / m
3. Synthetic Procedures

Standard operating procedure for the synthesis of the protected peptides via SPPS (SOP 1)

The loading of the resin was performed according to a procedure described in literature. The appropriate Fmoc-protected amino acid (2.0 eq. relative to resin loading capacity) was dissolved in DCM/ DMF (1:1, 10 mL/ g resin) and added to the 2-chlorotrityl-chloride resin. This is followed by the addition of DIPEA (2.0 eq. relative to the resin capacity). After shaking for 5 min at room temperature additional DIPEA (3.0 eq. relative to the resin capacity) was added. The reaction mixture was shaken for 1 h at room temperature and afterwards treated with MeOH (1 mL/g resin) and shaken for 15 min. The vessel was drained and the beads were washed consecutively three times each with DCM, DMF, DCM and MeOH. Afterwards the beads were dried under in vac overnight.

The following step-wise chain elongation was performed using the CS 136XT peptide synthesizer, which is an automated batch peptide synthesizer. The procedure is described in the following. The dried beads were swollen in DCM p.a. for 10 min while shaking the reaction vessel. After sucking off the solution, piperidine (20% in DMF) was added and the vessel was shaken for 20 min. After draining of the vessel the beads were washed four times with DMF and twice with DCM. The resin was treated with a solution of the corresponding Fmoc-protected amino acid (4.0 eq.), HBTU (4.0 eq.), HOBt (4.0 eq.) and DIPEA (6.0 eq.) in DMF. After shaking for 1 h the solution was removed and the resin was washed five times with DMF. This procedure was repeated with the corresponding amino acid for every coupling process, starting with the Fmoc deprotection on the resin. Finally the resin was washed with DCM.

The cleavage of resin-bound peptides was carried out according to a procedure described in literature. The beads were shaken for 45 min in a solution of trifluoroacetic acid (TFA) and DCM (1:1). Afterwards the solution was drained from the reaction vessel and the beads were washed at least two times with a small amount of DCM. The collected solutions were concentrated under reduced pressure and the product precipitated out of a 5°C solution of Et₂O. After centrifugation, and decanting the liquid phase the precipitate was washed with H₂O and lyophilized. The whole procedure was repeated three times.
Standard operation procedure for the cleavage of the 'Bu/ Trt-protection groups (SOP 2)

The 'Bu protected compound was treated with 8 mL TFA (50%) in DCM; for Trt-cleavage 5 vol% TIS was also added. The solution was stirred 1 h at room temperature, concentrated under reduced pressure and another 8 mL of the 1:1 TFA/ DCM solution were added. After removal of the solvent under reduced pressure and after lyophilization the desired product was obtained without further purification.

Standard operation procedure for the cleavage of Cbz-protection groups (SOP 3)

The Cbz-protected compound was dissolved in 10 mL MeOH. 10 wt% Pd/C were added and the suspension was stirred under an atmosphere of hydrogen for 12 h at room temperature. The catalyst was afterwards removed via filtration over Kieselguhr. After removal of the solvent under reduced pressure, the desired product was obtained without further purification.

Standard operation procedure for the cleavage of Fmoc-protection groups (SOP 4)

The Fmoc-protected compounds were dissolved in a 10 vol% solution of piperidine in CHCl₃ and stirred for 2 h at room temperature. The solvents were removed in vac and the residue purified via size exclusion chromatography (Sephadex® LH 20, MeOH). The obtained product was used after lyophilization

2,5-dibromophthalonitrile (400 mg, 1.4 mmol, 1.0 eq.), 4-hydroxy-thiophenol (818 mg, 6.5 mmol, 4.6 eq.) and potassium carbonate (1.16 g, 8.4 mmol, 6.0 eq.) were added to a 100 mL round bottom flask. The flask was evacuated and purged with argon. After this evacuation-argon-filling operation was repeated once, dry DMF (15 mL) was added to the flask. The solution was stirred at 45 °C for 6 h. Then the reaction was very carefully quenched with 4 M HCl (50 mL), the product precipitated as yellow-green solid. This solid was separated by filtration and washed with copious amounts of distilled water. The product was purified by recrystallization from DMF. Finally, the product was dried in vacuo and obtained as a yellow-green solid.

PyBOP (37 g, 72 μmol, 3.0 eq.) was added to a solution of 13 (12 mg, 24 μmol, 1.0 eq.), 2 (175 mg, 60 μmol, 2.5 eq.) and DIPEA (42 μL, 240 μmol, 10.0 eq.) in DMF (1 mL). The reaction mixture was stirred overnight at room temperature. The solvent was removed under reduced pressure and the residue was purified via size exclusion chromatography (Sephadex® LH 20, MeOH).

**Yield:** 108 mg (22 μmol, 92%); colorless, amorphous solid.

**Molecular formula:** C270H₃32N₃₀O₅₂S₂

**MALDI-MS (ACN/ H₂O) (m/z):** Calculated for [M+Na]⁺: 4915.37, found: 4914.73.

Compound 16

Tetrachloroterephthalonitrile (500 mg, 1.9 mmol, 1.0 eq.) 4-hydroxy-thiophenol (1.39 g, 11 mmol, 5.8 eq.) and potassium carbonate (3.18 g, 23 mmol, 12.1 eq.) were added to a 100 mL round bottom flask. The flask was evacuated and filled with argon (3x). After that dry DMF (30 mL) was added to the flask and solution was stirred at 45°C for 6 h. Then the reaction was quenched with quenched very slowly with 4 M HCl (50 mL) and the product precipitated as a red-orange solid. This solid was separated by filtration and washed with copious amounts of distilled water. The product was dried in vacuum.

Yield: 1.11 g (1.78 mmol, 94%), red-orange solid.

Molecular Formula: C₃₂H₂₀N₂O₄S₄.

ESI-HRMS (m/z): Calculated for [M-H]: 623.0233, found: 622.9556

¹H-NMR (300 MHz, DMSO-d₆): δ/ ppm = 9.77 (s, 4H, CH²Ar), 7.05 (d, J = 9.8 Hz, 8H, CH²Ar), 6.69 (d, J = 13.5 Hz, CH²Ar).

Compound 17

16 (100 mg, 160 μmol, 1.0 eq.) and potassium carbonate (1.16 g, 8.4 mmol, 53.0 eq.) were added to a 100 mL round bottom flask. Dry DMF (15 mL) and 4-buty1 bromoacetate (267 mg 1.93 mmol, 12.0 eq.) was added to the flask and the solution was stirred at 40°C for 1 d followed by quenching of the reaction mixture with distilled water. The product precipitates as yellow solid. This solid was separated by filtration and washed with copious amounts of distilled water. The product was dried in vacuo.

Yield: 176 mg (158 μmol, 99%); yellow solid.

Molecular Formula: C_{56}H_{60}N_2O_{12}S_4.
