General Experimental Procedures.

Reactions requiring anhydrous conditions were carried out under a nitrogen atmosphere. THF were freshly distilled from sodium/benzophenone ketyl and transferred via syringe. Dichloromethane was freshly distilled from P₂O₅. Pyridine was freshly distilled over KOH. Commercially available reagents were used as received. IR spectra were recorded with a Bruker Tensor 27 FT-IR spectrometer (film). 1D and 2D NMR spectra were collected on a Bruker AV-600 spectrometer. The solvent used for NMR spectroscopy was deuteriated dimethyl sulfoxide unless stated otherwise, using tetramethylsilane as the internal reference. Chemical shifts are given in parts per million, and J values are given in Hertz. HRESIMS were measured with an Agilent G6230 TOF mass spectrometer. All chromatographic manipulations used silica gel (100-200 mesh, 200-300 mesh, Qingdao Marine Chemical Ltd., Qingdao, China) as the adsorbent. Reactions were monitored using thin layer chromatography (TLC) on aluminuml. TLC plates were visualized by UV radiation at a wavelength of 254 nm or stained by exposure to an ethanolic solution of concentrated sulfuric acid and anisaldehyde, followed by charring where appropriate. The following abbreviations are used to designate signal multiplicity: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br = broad.
Experimental Procedures

General Procedure I for Reduction of Enones

To a solution of an enone (1.0 mmol) and CeCl₃ (1.0 mmol) in DCM/MeOH (1:1, 10 mL) was added NaBH₄ (2.0 mmol) over 10 min in portions at -60 °C. After stirring for 1.5 h at -60 °C, the reaction mixture was quenched by addition of saturated NH₄Cl solution. The mixture was extracted with EtOAc, washed with brine, and dried over anhydrous Na₂SO₄. Filtration, concentration, and silica gel column chromatography (EtOAc/petroleum ether = 1:6) gave the products.

General Procedure II for Reduction of Enones

To a solution of an enone (1.0 mmol) in THF (10 mL) was added DABIL-H (1.5 mL of a 1.0 M solution in hexane, 1.5 mmol) at -78 °C. After stirring for 5 min at -78 °C, the reaction mixture was quenched with MeOH (1.0 mL). The mixture was diluted with EtOAc, washed with sat. aq. sodium potassium tartrate, and dried over anhydrous Na₂SO₄. Filtration, concentration, and silica gel column chromatography (EtOAc/petroleum ether = 1:10) gave the products.

General Procedure III for Etherification of Allylic Alcohols

A solution of an allylic alcohol (1.0 mmol) in DCM (10 mL) was treated with imidazole (3.0 mmol) and tert-butyldimethylsilyl chloride (1.5 mmol) at room temperature and the mixture was stirred overnight. The reaction mixture was diluted with DCM, washed with sat. aq. NH₄Cl solution and brine, and dried over anhydrous Na₂SO₄. Filtration, concentration, and silica gel column chromatography (EtOAc/petroleum ether = 1:50) gave the products.

General Procedure IV for Cracking of tert-Butyldimethylsilyl Ether

To a stirred solution of tert-butyldimethylsilyl ether (1.0 mmol) and AcOH (0.4 mmol) in THF (5.0 mL) was added dropwise tetra(n-butyl)ammonium fluoride (1.5 mL of a 1.0 M solution, 1.5 mmol) at 0 °C, and then the reaction solution was transferred to room temperature. After stirring overnight, the reaction mixture was diluted with EtOAc, washed with brine, and dried over anhydrous Na₂SO₄. Filtration, concentration,
and silica gel column chromatography (EtOAc/petroleum ether = 1:5) gave the products.

**General Procedure V for Methanesulfonylation of Epoxy Alcohols**

To a mixture of epoxy alcohol (1.0 mmol) and Et₃N (2.0 mmol) in DCM (5.0 mL) was added methanesulfonyl chloride (1.2 mmol) at 0 °C. After the reaction had been completed, the mixture was diluted with DCM and washed with sat. aq. NH₄Cl and brine, and dried over anhydrous Na₂SO₄. Filtration, concentration, and the products were obtained without further purification.

**General Procedure VI for Hydrogenolysis of Mesylates**

A solution of mesylate (1.0 mmol) in THF (8.0 mL) was added dropwise to a stirred suspension of lithium aluminum hydride (3.0 mmol) in THF (1.0 mL) at 0 °C. Then, the reaction mixture was refluxed for 4 h and excess reagent was hydrolyzed by dropwise addition of water, followed by 2 N NaOH. The mixture was extracted with EtOAc, washed with brine, and dried over anhydrous Na₂SO₄. Filtration, concentration, and silica gel column chromatography (EtOAc/petroleum ether = 1:8) gave the products.
