1. General Information.
All reactions were prepared and sealed using a glass flask in a glove box filled with argon. Then the reactions were carried out on a multi-zone reaction platform which was purchased from Tokyo Rikakikai Co., LTD (CCX-1102). Solvents were dried and distilled under argon prior to use. Commercial reagents were purchased from Sigma Aldrich or Alfa Aesar and used as received except for the benzaldehyde which was distilled under argon prior to use. dcpp (1,3-Bis(dicyclohexylphosphine)propane) was used as a prepared solution in toluene (0.1 mg/µL). NMR spectra were recorded on a bruker ASCEND spectrometer (¹H, 600 MHz; ¹³C{¹H}, 151 MHz) and (¹H, 700 MHz; ¹³C{¹H}, 176 MHz). ¹H NMR and ¹³C NMR, chemical shift δ is given relative to TMS and referenced to the solvent signal. Column chromatography was performed using silica gel. Analytical TLC was done using pre-coated silica gel 60 F₂₅₄ plates. GC analysis was performed using Aglient GC-7890B equipped with a capillary column (DB-FFAP, 30 m×0.32 mm) using a flame ionization detector. GC-MS was performed using GCMS-QP2020 with Rtx-5MS (30 m×0.25 mm) column. UV-vis spectra were recorded with Shimadzu UV-2550.

2 Cobalt-Catalyzed Intermolecular Hydroacylation of Aldehydes

Procedure: To a dry flask containing a toluene (1 mL) solution of cobaltous salt (0.04 mmol, 10 mol%), In (18.4 mg, 0.16 mmol, 40 mol%), phosphine ligand (0.06 mmol, 15 mol%) and additive (1.2 mmol, 3.0 equiv.), benzaldehyde (42.8 mg, 0.4 mmol, 1.0 equiv.) were added in a glove box. The mixture was then stirred and heated up to the designated temperature. After reaction for 24 h, the mixture was cooled to room temperature and extracted with EtOAc (3×10 mL), which was filtered by diatomite subsequently. The filtrate was detected by GC with biphenyl as internal standard.

3 Cobalt-Catalyzed Intramolecular Hydroacylation of Aldehydes

**Procedure:** To a dry flask containing a toluene (1 mL) solution of cobaltous salt (0.02 mmol, 5 mol%), element metal (0.08 mmol, 20 mol%), phosphine ligand (0.02 mmol, 5 mol%) and additive (0.02 mmol, 5 mol%), phthalaldehyde (53.7 mg, 0.4 mmol, 1.0 equiv.) were added in a glove box. The mixture was then stirred and heated up to the designated temperature. After reaction for 9 h, the mixture was cooled to room temperature and extracted with EtOAc (3×10 mL), which was filtered by diatomite subsequently. The filtrate was detected by GC with biphenyl as internal standard.

4 Mechanistic Insights into the Cobalt-Catalyzed Intermolecular Hydroacylation

4.1 Deuterium-Labeling Experiments

4.1.1 Synthesis of 1a-d

Scheme S1.

N,N-Dimethylformamide-d₇ (1.03 g, 12.9 mmol, 1.1 equiv.) was placed in a three-neck flask in 50 mL of THF at −80 °C. Next, 1.8 M phenyllithium solution (6.5 mL, 11.7 mmol, 1.0 equiv.) was slowly added to the solution at −80 °C under argon. After being stirred for 3 h, the mixture solution was warmed up to room temperature overnight. All solvents were removed by a rotary vacuum at a low temperature about 15 °C, affording a pale yellow oil. This resulting yellow oil was purified by column chromatography (silica gel, DCM: hexane = 1: 6) to offer a crude product, which was further purified by distillation (100 kPa, 116 °C, yield: 63%).
1a-d: $^1$H NMR (600 MHz, CDCl$_3$, 298K): $\delta = 10.01$ (s, 0.02/1H, CHO), 7.87 (m, 2H, o-Ph), 7.62 (m, 1H, p-Ph), 7.52 (m, 2H, m-Ph). $^2$H NMR (46 MHz, CHCl$_3$, 298K): $\delta = 10.00$ (s, C(O)D).

$^1$H (600M, CDCl$_3$, 298K) and $^2$H NMR (46M, CHCl$_3$, 298K) of 1a-d.

4.1.2 Synthesis of 2aa-d$_n$

Scheme S2.

To a dry flask containing a toluene (1mL) of CoI$_2$ (12.6 mg, 0.04 mmol, 10 mol%), In (18.4 mg, 0.16 mmol, 40 mol%), L$_4$ (0.1 mg/µL $\times$ 261 µL, 0.06 mmol, 15 mol%) and iPr$_2$NEt (155.1 mg, 1.2 mmol, 3.0 equiv.), benzaldehyde-α-d$_1$ (42.9 mg 0.40 mmol, 1.0 equiv.) or benzaldehyde 1a (42.8 mg, 0.4 mmol, 1.0 equiv.) was added in a glove box. The mixture was then stirred and heated to 120°C for 15h. At the end of the reaction, the mixture was cooled to room temperature and extracted with EtOAc (3×10 mL), which was filtered by diatomite subsequently and detected by GC determining the yield. Then the filtrate was dried by Na$_2$SO$_4$ overnight and concentrated, then purified by column chromatography (Developing solvent on chromatography purification: petroleum ether/ethyl acetate 30:1; Yield 22.7 mg,
53%.

2aa-d2: \textbf{^1H NMR} (600 MHz, CDCl$_3$, 298 K): $\delta = 8.09$ (m, 2H, o-Ph), 7.56 (m, 1H, p-Ph), 7.46 (m, 2H, o-Ph), 7.45 (m, 2H, m-Ph), 7.40 (m, 2H, m-Ph), 7.36 (m, 1H, p-Ph), 5.36 (s, 0.18/2H, CH$_2$). \textbf{^2H NMR} (92 MHz, CHCl$_3$, 298K): $\delta = 5.36$ (s, CD$_2$).

4.1.3 Cross-over Deuterium Experiment

To a dry flask containing a toluene (1mL) of CoI$_2$ (12.6 mg, 0.04 mmol, 10 mol%), In (18.4 mg, 0.16 mmol, 40 mol%), L$_4$ (0.1 mg/µL $\times$ 261 µL, 0.06 mmol, 15 mol%) and iPr$_2$NEt (155.1 mg, 1.2 mmol, 3.0 equiv.), benzaldehyde-$\alpha$-d$_1$ (42.9 mg 0.40 mmol, 1.0 equiv.) and 4-Me-PhCHO 1b (48.1 mg, 0.4 mmol, 1.0 equiv.) was added in a glove box. The mixture was then stirred and heated to 120$^\circ$C for 15h. At the end of the reaction, the mixture was cooled to room temperature and extracted with EtOAc (3$\times$10 mL), which was filtered by diatomite subsequently and detected by GC-MS.

4.2 Experiments for Screening the Induction Period.

Procedure: The reactions were performed in parallel sealed flask for designated
hours on multi-zone reaction platform. To a dry flask containing a toluene (1mL) of CoI₂ (12.6 mg, 0.04 mmol, 10 mol%), In (18.4 mg, 0.16 mmol, 40 mol%), L₄ (0.1 mg/µL × 261 µL, 0.06 mmol, 15 mol%) and iPr₂NEt (155.1 mg, 1.2 mmol, 3.0 equiv.), benzaldehyde 1a (42.8 mg, 0.4 mmol, 1.0 equiv.) was added in a glove box. A series of parallel reactions was prepared in the same manner and moved out of the glove box. These parallel reactions were heated to designated temperature for designated hours on multi-zone reaction platform. Aliquotes (100 µL) removed of every reaction were immediately frozen at −20 °C to stop further reactions. All samples were extracted with EtOAc (3×10 mL) and filtrated by diatomite. The conversion of substrate 1a was monitored by GC.

4.3 Amalgamation Reaction

Scheme S3.

Procedure: Two parallel reactions were performed in sealed flask on multi-zone reaction platform. To the dry flask containing a toluene (1mL) of CoI₂ (12.6 mg, 0.04 mmol, 10 mol%), In (18.4 mg, 0.16 mmol, 40 mol%), L₄ (0.1 mg/µL × 261 µL, 0.06 mmol, 15 mol%) and iPr₂NEt (155.1 mg, 1.2 mmol, 3.0 equiv.), benzaldehyde 1a (42.8 mg, 0.4 mmol, 1.0 equiv.) was added in a glove box. The sealed flasks moved out of the glove box were heated to 120 °C for 2 h. One of them was stopped and the other one was again put into the glove box to add mercury (4.0 mmol, 802.4 mg). Then the latter was sealed and moved out to continue reacting for 13 h at 120 °C. It turned out that the yield of former was 29%, while the latter was 81% (detected by GC with biphenyl as the internal standard) indicating that the catalyst was homogeneous.

4.4 UV-visible analysis

Procedure: To a dry flask containing a toluene (739 µL) solution of CoI₂ (12.6 mg,
0.04 mmol, 10 mol%), In (18.4 mg, 0.16 mmol, 40 mol%), L₄ (0.1 mg/µL × 261 µL, 0.06 mmol, 15 mol%), [iPr₂NEt (155.1 mg, 1.2 mmol, 3.0 equiv.)], benzaldehyde (0.4 mmol, 1.0 equiv.) was added in the glove box. The reactions were all performed in parallel sealed flask for designated hours at 80 °C. Aliquots (30 µL) removed were immediately frozen at −20 °C to stop further reactions and was added 2970 µL toluene for UV analysis.

Figure S1. UV-visible Spectra Acquired from Monitoring the Reduction of CoI₂ for 10 h in the absence of 1a. Conditions: (A) CoI₂ (0.4 mM), CoI₂ : In : L₄ : iPr₂NEt = 1:4:1.5: 30; (B) CoI₂ (0.4 mM), CoI₂ : In : L₄ = 1:4:1.5.

Figure S6. Reaction rates with respect to concentration of 1a.

4.6 Kinetic Studies.

Procedure: The reactions were performed in parallel sealed flasks for designated time on multi-zone reaction platform. To a dry flask containing a toluene (1 mL) solution of CoI$_2$ (12.6 mg, 0.04 mmol, 10 mol%), In (18.4 mg, 0.16 mmol, 40 mol%), L$_4$ (0.1 mg/µL × 261 µL, 0.06 mmol, 15 mol%), [iPr$_2$NEt (155.1 mg, 1.2 mmol, 3.0 equiv.)], the benzyl aldehyde (0.1~0.8 mmol) was added in the glove box. Five parallel reactions were prepared in the same manner and moved out of the glove box. These parallel reactions were heated to 120 °C for designated hours on multi-zone reaction platform. Aliquots (100 µL) removed of every reaction were immediately frozen at −20 °C to stop further reactions. All samples were extracted with EtOAc
(3×10 mL) and filtrated by diatomite. The disappearance of 1a and appearance of 1ja were monitored by GC.

<sup>a</sup>General conditions: Ia (0.4 mmol), CoI<sub>2</sub> (10 mol%), In (40 mol%), L<sub>4</sub> (15 mol%), iPr<sub>2</sub>NEt (3.0 equiv.), toluene (1 mL), 120 °C, 3 h, yields determined by GC-MS area normalization.

4.7.2 Procedure for Hammett Study

The reactions were performed in parallel sealed flask for designated hours on multi-zone reaction platform. To a dry flask containing a toluene (1 mL) solution of CoI<sub>2</sub> (12.6 mg, 0.04 mmol, 10 mol%), In (18.4 mg, 0.16 mmol, 40 mol%), L<sub>4</sub> (0.1 mg/µL x 261 µL, 0.06 mmol, 15 mol%), with and without iPr<sub>2</sub>NEt (155.1 mg, 1.2 mmol, 3.0 equiv.), the respective para-substituted benzyl aldehyde (0.4 mmol, 1.0 equiv) and cyclohexanal Ij (224.3 mg, 2.0 mmol, 5.0 equiv.) were added in the glove box. Five parallel reactions were prepared in the same manner and moved out of the glove box. These parallel reactions were heated to designated temperature for designated hours on multi-zone reaction platform. Aliquots (100 µL) removed of every reaction were immediately frozen at −20 °C to stop further reactions. All samples were extracted with EtOAc (3×10 mL) and filtrated by diatomite. The yield of Ij[a,e,f,g] was monitored by GC. As a result, the reaction rate of each was obtained, then the Hammett slope and electronic effects on induction period were also obtained.
Figure S8. Product formation as a function of time for reactions of 1e/1f and 1g. Conditions: 1j (2.0 mmol, 5.0 equiv.), 1[e, f] (0.4 mmol, 1.0 equiv.), CoI₂ (10 mol%), In (40 mol%), L4 (15 mol%), toluene (1 mL); iPr₂NEt (3.0 equiv.); 120 °C; yield determined by GC-MS area normalization.

5 Preparation of Esters

General Procedure

To a dry flask containing a toluene (1 mL) solution of CoI₂ (12.6 mg, 0.04 mmol, 10 mol%), In (18.4 mg, 0.16 mmol, 40 mol%), L4 (0.1 mg/µL × 261 µL, 0.06 mmol, 15 mol%) and iPr₂NEt (155.1 mg, 1.20 mmol, 3.0 equiv.), aldehyde (0.4 mmol, 1.0 equiv.) were added in a glove box (a dark brown solution formed immediately upon the addition of toluene to a heterogeneous mixture of CoI₂ and dcpp solution). The mixture was then stirred and heated up to 120°C. After reaction for 15 h, the mixture was cooled to room temperature and extracted with EtOAc (3×10 mL), which was filtered by diatomite subsequently. The filtrate was dried over Na₂SO₄, followed by concentration on rotation machine. The resulted residue was finally purified through column chromatography.

Synthesis of 2aa. Developing solvent on chromatography purification: petroleum ether/ethyl acetate 30:1; Yield 36.5 mg, 86%.
