All the commercially available reagents and solvents were used without further purification. 1,2-Diaza-1,3-dienes 6a–k were synthesized as a mixture of E/Z isomers as previously reported. Chromatographic purification of compounds was carried out on silica gel (60–200 μm). TLC analysis was performed on pre-loaded (0.25 mm) glass supported silica gel plates (Kieselgel 60); compounds were visualized by exposure to UV light and by dipping the plates in 1% Ce(SO$_4$)$_3$·4H$_2$O, 2.5% (NH$_4$)$_6$Mo$_7$O$_{24}$·4H$_2$O in 10% sulphuric acid followed by heating on a hot plate. All $^1$H NMR and $^{13}$C NMR spectra were recorded at 400 and 100.56 MHz, respectively. Proton and carbon spectra were referenced internally to solvent signals, using values of $\delta = 2.49$ ppm for proton (middle peak) and $\delta = 39.50$ ppm for carbon (middle peak) in DMSO-$d_6$ and $\delta = 7.27$ ppm for proton and $\delta = 77.00$ ppm for carbon (middle peak) in CDCl$_3$. The following abbreviations are used to describe peak patterns where appropriate: s = singlet, d = doublet, t = triplet q = quartet, sep = septet, m = multiplet and br = broad signal. All coupling constants ($J$) are given in Hz. FT-IR spectra were obtained as Nujol mulls. Mass spectra were obtained by EI (70eV) or by ESI-MS analyses. Elemental analyses were within ± 0.4 of the theoretical values (C, H, N). Melting points were determined in open capillary tubes and are uncorrected.

2. General procedure for synthesis of ethyl 3-(butylamino)-2-(phenylcarbamothioyl)but-2-enoate 5a under SFC conditions.

$n$-Butyl amine 1a (0.5 mmol) was added to methyl 3-oxobutanoate 2a (0.55 mmol) under solvent-free conditions at room temperature and vigorously stirred. After 0.5 h, phenyl isothiocyanate 4a (0.50 mmol) was added and the reaction was stirred until the disappearance of the enamino ester 3 (6.5 h monitored by TLC). Then, the crude was chromatographed on silica gel column (elution mixture: cyclohexane: ethyl acetate) obtaining the corresponding ethyl 3-(butylamino)-2-(phenylcarbamothioyl)but-2-enoate 5a.

3. General procedure for synthesis of 3-alkylamino-2-(carbamothioyl)but-2-enoates (ACTs) 5a–k

Butyl amine 1a (0.5 mmol) was added to $\beta$-ketoesters 2a–e (0.55 mmol) under solvent-free conditions at room temperature and vigorously stirred. After 0.5 h aryl isothiocyanates 4a–e (0.50 mmol) in MeOH (1.5 mL) were added and the reactions were stirred until the disappearance of the enamino esters 3 (6.0–18.0 h monitored by TLC). The compounds 5a,c–j crystallized directly from the reaction medium and were collected as pure products by filtration. From the mother solution, the methanol was evaporated under reduced pressure and the residue ACTs 5a,c–j were purified by chromatography on silica gel column (elution mixture: cyclohexane: ethyl acetate) and successively crystallized in methanol. In the other cases, the reaction solvent was evaporated under reduced pressure and the final ACTs 5b,k were purified by chromatography on silica gel column (elution mixture: cyclohexane: ethyl acetate) and successively crystallized in methanol.

5 One-pot procedure for synthesis of 2,5-dihydrothiophenes 7a-w

n-Butyl amine 1a (0.5 mmol) was added to β-ketoesters 2a-i (0.55 mmol) under solvent-free conditions and vigorously stirred at room temperature. After 0.5 h aryl isothiocyanates 4a-c (0.5mmol) in MeOH (1.5 mL) were added and the reactions were stirred until the disappearance of the enamino esters 3 (6.0-18.0h monitored by TLC). DDs 6a-k (1.0 mmol) in MeOH (2.0 mL) were added to the reaction medium and magnetically stirred until the complete disappearance of the ACTs 5 (3.0-5.0 h monitored by TLC). Then, the reaction solvent was evaporated under reduced pressure and the desired 2,5-dihydrothiophenes 7a-w were purified by chromatography on silica gel column (elution mixture: cyclohexane: ethyl acetate).

General procedure for synthesis of 5-amino thiophene-2,4-dicarboxylates 8a-j.

To a solution of 2,5-dihydrothiophenes 7a-d,g-i,k,p-s,u,v (0.5 mmol) in acetone/water (90/10, 5.0 mL) Amberlyst 15 (4.0 equiv) was added and the reaction mixture was softly stirred at room temperature. At the disappearance of the starting 2,5-dihydrothiophenes 7 (2.0-4.0 h, monitored by TLC) the reaction solvent was evaporated under reduced pressure and the desired 2,5-5-amino thiophene-2,4-dicarboxylates 8a-j were purified by chromatography on silica gel column (elution mixture: cyclohexane: ethyl acetate).

Spectral data of 5-amino thiophene-2,4-dicarboxylates 8a-j.
