Materials and Methods

General. All reactions dealing with air- and moisture-sensitive compounds were carried out in dry reaction vessels under a nitrogen atmosphere. \( ^1 \)H and \( ^{13} \)C nuclear magnetic resonance (NMR) spectra were recorded on Agilent 600 MHz NMR spectrometer. \( ^1 \)H and \( ^{13} \)C NMR spectra are reported in parts per million (ppm) downfield from an internal standard, tetramethylsilane (0 ppm) and CHCl\(_3\) (77.0 ppm), respectively. ESI high-resolution mass spectra (HRMS) were recorded on a Waters SYNAPT G2. IR spectra were recorded in a PerkinElmer FT/IR-S100 spectrometer. Melting points were determined using a capillary melting point apparatus and are uncorrected.

Materials. Unless otherwise noted, materials were purchased from commercial suppliers and were used as received. Anhydrous MeCN was distilled over CaH\(_2\) and stored under N\(_2\).

We tried the following conditions and did not find the target product. In the following conditions, we found the by-product triphenylene, which was produced from benzyne precursor 2a, phenyl pivalate and tert-butoxybenzene.

Preparation of Substrates

Synthesis of enol triflates

**General procedure A**\(^1\): To solution of Cyclohexanone derivative (5 mmol) in anhydrous THF (25 mL) was added LiHMDS (6 mL, 6 mmol, 1.0 M in THF, 1.2 equiv) at \(-78^\circ C\). After 1 h at \(-78^\circ C\) under an argon atmosphere, a solution of PhNTf\(_2\) (2.5 g, 7 mmol, 1.4 equiv) in anhydrous THF (5 mL) was slowly added to the mixture solution at \(-78^\circ C\). The mixture solution was allowed to warm to rt over a period of 4 h and stirred for additional 12 h. After the completion of the reaction, the resulting solution was treated with saturated aqueous NH\(_4\)Cl (10 mL) and extracted with ethyl acetate (3 x 20 mL). The combined organic solution was washed with saturated aqueous Na\(_2\)CO\(_3\) (20 mL), dried over anhydrous MgSO\(_4\), filtered and concentrated under reduced pressure. The residue oil was purified by flash column chromatography on silica gel to afford the product as a pale yellow oil.

Following the general procedure A to produce \(1c, 1o, 1p, 1q, 1r\).

**General procedure B**\(^2\): To a solution of Cyclohexanone derivative (5 mmol) in anhydrous CH\(_2\)Cl\(_2\) (15 mL) was added 2-chloropyridine (0.52 mL, 5.5 mmol, 1.1 equiv) at 0 °C. After 10 min at 0 °C, trifluoromethanesulfonic anhydride (1.0 mL, 6 mmol, 1.2 equiv) was added dropwise. The resulting solution was warmed to rt and stirred for 2 h under an argon atmosphere. After the completion of the reaction, the solution was concentrated and the resulting cherry-color oil was purified by flash column chromatography on silica gel to afford the product as a pale yellow oil.

Following the general procedure B to produce \(1a, 1b, 1d, 1e, 1f, 1g, 1h, 1i, 1j, 1ai, 1aj, 1al\).

**General procedure C**\(^3\): To solution of Cyclohexanone derivative (5 mmol) in anhydrous THF (25 mL) was added LDA (3 mL, 6 mmol, 2.0 M in THF, 1.2 equiv) at \(-78^\circ C\). After 1 h at \(-78^\circ C\) under an argon atmosphere, a solution of PhNTf\(_2\) (1.79 g, 5 mmol, 1.0 equiv) in anhydrous THF (5 mL) was slowly added to the mixture solution at \(-78^\circ C\). The mixture solution was allowed to warm to rt over a period of 4 h and stirred for additional 12 h. After the completion of the reaction, the resulting solution was treated with saturated aqueous NH\(_4\)Cl (10 mL) and extracted with ethyl acetate (3 x 20 mL). The combined organic solution was washed with saturated aqueous Na\(_2\)CO\(_3\) (20 mL), dried over anhydrous MgSO\(_4\), filtered and concentrated under reduced pressure. The residue oil was purified by flash column chromatography on silica gel to afford the product as a pale yellow oil.

Following the general procedure C to produce \(1k, 1l, 1m, 1n\).

**General procedure D**\(^4\):

**Preparation of saturated aqueous LiOH solution.**

55.14g of LiOH was dissolved in 460mL of deionized H2O to obtain a saturated solution (approximately 5M).

**General Procedure for the Synthesis of \((Z)\)-Enol Triflates**

The starting acetoacetate derivative (4 mmol) was added to a round-bottom flask and dissolved in either hexanes or toluene (20 mL, 0.2M). The solution was cooled with an ice bath to 5-10°C (internal temperature) followed by addition of a saturated aqueous solution of LiOH (6 mL, ~30
mmol) in one portion. The resulting biphasic mixture was vigorously stirred at 5-10°C for ~5 minutes followed by the addition of triflic anhydride (10 mmol) dropwise at a rate to maintain the internal temperature between 5-15 ºC. Upon completion of the reaction (as judged by TLC, typically <10 min), the biphasic solution was diluted with H2O (5mL) and the layers were separated. The aqueous layer was extracted with EtOAc (1 x 10mL). The combined organic layers were washed with H2O (1 x 5mL), brine (1 x 5mL), and dried over MgSO4. The organic layer was filtered and concentrated under reduced pressure to yield the corresponding crude (Z)-enol triflate.

Following the general procedure D to produce 1s, 1t, 1u, 1v, 1w, 1x, 1y, 1z, 1aa, 1ac, 1ad, 1ae, 1af, 1ag, 1ah.

**A General Procedure for Pd-catalyzed arylene annulation by enol triflates**

A 10 mL of Schlenk tube equipped with a stirrer bar was charged with Pd$_2$(dba)$_3$ (5 mol %), tri-o-tolylphosphate (20 mol %), CsF (1.2 mmol, 6.0 equiv), and LiOPiv (0.2 mmol, 1.0 equiv) in the glove box. Then, the Schlenk tube removed from glove box and quickly evacuated and refilled with Ar for three times, followed by the addition of MeCN (3.2 mL), enol triflates (0.20 mmol, 1.0 equiv), and silylaryl triflate (0.60 mmol, 3.0 equiv). The Schlenk tube was sealed with a Teflon screwcap under Ar flow and the reaction mixture was stirred at 60 °C for 12 h. Upon cooling to room temperature, the reaction mixture was diluted with 10 mL of ethyl acetate, filtered through a pad of silica gel, followed by washing the pad of the silica gel with ethyl acetate (20 mL). Subsequently, the filtrate was concentrated under reduced pressure. The residue was purified by flash chromatography on silica gel to afford the desired product.

**Friedel-Crafts cyclisation**

Step 1. The ethyl 10-phenylphenanthrene-9-carboxylate (3s) (326.4 mg, 1.0 mmol) was added to a mixture of concentrated aqueous HBr (5mL) and glacial AcOH (20 mL) and then refluxed for 10 h. Upon cooling to room temperature, the reaction mixture was diluted with 20 mL of ethyl acetate, washed with water (50 mL), dried (MgSO$_4$) and concentrated. The residue was purified by chromatography to afford the desired product 10-phenylphenanthrene-9-carboxylic acid (233 mg, 78%) as a white solid.
10-phenylphenanthrene-9-carboxylic acid (5): White solid (78% yield, eluent = DCM/MeOH (20:1)); \(^1\)H NMR (600 MHz, d-DMSO): \(\delta\) 13.27 (s, 1H), 8.94 (t, \(J = 7.6\) Hz, 2H), 7.87 (d, \(J = 7.9\) Hz, 1H), 7.75 (dt, \(J = 7.6, 2H\)), 7.57 (t, \(J = 7.6\) Hz, 1H), 7.48 (ddd, \(J = 32.1, 16.1, 7.9\) Hz, 4H), 7.38 (d, \(J = 7.3\) Hz, 2H); \(^{13}\)C NMR (150 MHz, d-DMSO): \(\delta\) 170.18, 137.84, 134.56, 132.41, 130.71, 130.11, 129.72, 128.65, 128.34, 128.19, 128.01, 127.90, 127.78, 127.50, 127.34, 126.18, 123.74, 123.63.

Step 2. A 10 wt% solution of PPA acid in methanesulfonic acid (15 mL) was heated to 90 °C and then 10-phenylphenanthrene-9-carboxylic acid was added over the course of 10 min. Once the addition was completed the suspension was heated at 120 °C for 4 hours until a dark solution was observed, which was then cooled to room temperature and poured into ice water. After that, NaOH (cold sat. aqueous solution) were sequentially added to the mixture. The aqueous layer was extracted with ethyl acetate (3×20 mL), the combined organic layers were dried over MgSO\(_4\), filtrated and concentrated in vacuo. The crude material was purified by flash column chromatography on silica gel to afford the desired product 13H-indeno[1,2-l]phenanthren-13-one (203 mg, 93%) as an orange solid.

13H-indeno[1,2-l]phenanthren-13-one (6): Orange solid (78% yield, eluent = petroleum ether/EtOAc (15:1)); \(^1\)H NMR (600 MHz, CDCl\(_3\)): \(\delta\) 9.19 – 9.14 (m, 1H), 8.61 (d, \(J = 8.3\) Hz, 1H), 8.51 (d, \(J = 8.2\) Hz, 2H), 7.92 (d, \(J = 7.4\) Hz, 1H), 7.74 – 7.68 (m, 1H), 7.67 – 7.56 (m, 4H), 7.44 (td, \(J = 7.6, 1.2\) Hz, 1H), 7.28 (t, \(J = 7.3\) Hz, 1H); \(^{13}\)C NMR (150 MHz, CDCl\(_3\)): \(\delta\) 195.77, 144.52, 143.73, 134.53, 134.21, 133.86, 130.90, 129.10, 128.76, 128.29, 127.52, 127.48, 127.28, 127.11, 125.93, 125.60, 125.21, 123.77, 123.39, 123.25, 122.56; IR (neat): \(\nu\) (cm\(^{-1}\)) 2988, 2899, 1699, 1602, 1504, 1195, 1064.
