1. General Considerations

All chemicals were purchased from Adamas Reagent, energy chemical company, J&K Scientific Ltd, Bide Pharmatech Ltd and Tansoole. The solvents were purchased from commercial suppliers and used without further purification. Unless stated otherwise, reactions were conducted in an over-dried test tube with volume of 20 ml under air atmosphere at room temperature. Azides were prepared following the known procedures. Flash column chromatography was performed over silica gel (200-300 mesh). $^1$H-NMR and $^{13}$C-NMR spectra were recorded on a Bruker Avance 500 spectrometer (500 MHz $^1$H, 125 MHz $^{13}$C) at room temperature. Chemical shifts were reported in ppm on the scale relative to CDCl$_3$ ($\delta = 7.26$ for $^1$H-NMR , $\delta = 77.00$ for $^{13}$C-NMR) as an internal reference. Coupling constants (J) were reported in Hertz (Hz). The following abbreviations are used to indicate signal multiplicity: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, and br = broad. High resolution mass spectra were recorded using a Thermo Fisher Scientific LTQ FT Ultra or Waters Micromass GCT Premier instrument.
2. Experimental Procedures

Typical procedure for the synthesis of benzyl azides

\[
\text{R}^\cdot \overset{\text{Br}}{\text{C}} + \text{NaN}_3 \xrightarrow{\text{Acetone/H}_2\text{O}} \text{R}^\cdot \overset{\text{N}_3}{\text{C}}
\]

In a 100 mL round-bottom flask, benzyl bromide (0.297 mL, 2.5 mmol) was dissolved in water (10 mL) and acetone (40 mL). Sodium azide (0.244 g, 3.75 mmol) was added in one portion, and the solution stirred overnight. Dichloromethane (50 mL) was added, and the organic layer separated. The aqueous layer was washed with dichloromethane (3 × 10 mL). The combined organic layers were dried over anhydrous Na\textsubscript{2}SO\textsubscript{4} and filtered. Solvent was removed under reduced pressure, the crude product was purified with flash chromatography (silica gel, pure petroleum ether). Spectroscopic data was consistent with previously reported results.\textsuperscript{1}

Typical procedure for the synthesis of other azide

\[
\text{R} + \text{NaN}_3 \xrightarrow{\text{DMSO/80°C}} \text{R}^\cdot \overset{\text{N}_3}{\text{C}}
\]

In a 125 mL round-bottom flask, NaN\textsubscript{3} (0.715 g, 11 mmol) was dissolved in DMSO (20 mL) and stirred until homogeneous. Bromobutane (1.072 mL, 10 mmol) was added, and the solution was stirred at 80°C overnight. Water (80 mL) was added, and the aqueous layer was extracted with ether (5 × 20 mL). The organic layers were combined, dried over anhydrous Na\textsubscript{2}SO\textsubscript{4}, and filtered. Solvent was removed under reduced pressure, the crude product was purified with flash chromatography (silica gel, pure petroleum ether).

Note: Azides are explosive substances that must be carefully handled and stored.

General procedure for the copper(I)-catalyzed three-component coupling of arylboronic acid, alkynes and azides

\[
\text{R}^1 + \text{R}^2\cdot \overset{\text{N}_3}{\text{C}} + \text{ArB(OH)}_2 \xrightarrow{\text{CuCl (20 mmol%) MeOLi (2 eq)}} \text{Air, rt, CH}_3\text{CN}
\]

General reaction: terminal alkynes (0.2 mmol), arylboronic acid (0.4 mmol), azides (0.3 mmol), CuCl (0.04 mmol), and MeOLi (0.4 mmol) were added in MeCN (2.5 mL) and stirred in a glass test tube for 12 h at room temperature under air. The reaction was monitored by TLC analysis. After the reaction was completed, the resulting mixture was evaporated to dryness and the crude product was purified with flash chromatography (silica gel, ethyl acetate: petroleum ether: =1:5 ~ 1:30).
Synthesis of terminal arylalkyne 1af

\[
\begin{align*}
&\text{Ethyl-1-((4-bromophenyl)sulfonyl)piperidine-2-carboxylate was prepared according to the literature procedure.}^2 \\
&\text{Ethyl piperidine-2-carboxylate hydrochloride (0.79 g, 5 mmol) and 4-bromobenzenesulfonyl chloride (1.28 g, 5 mmol) were dissolved in 50 mL DMF. Triethylamine (3 equiv) was then added dropwise. After stirring for 8 h at room temperature, the residue was suspended in 50 mL of ethyl acetate and washed with 2 M HCl (25 mL×3) and H}_2\text{O (25 mL). The organic layer was dried over anhydrous Na}_2\text{SO}_4, \text{and concentrated in vacuo. The crude reaction mixture was purified on silica gel. An oven-dried schlenk tube was charged with bromo-substrate (1 mmol), Pd(PPh}_3)_2\text{Cl}_2 (14 mg, 0.02 mmol) and CuI (7.6 mg, 0.04 mmol). The tube was taken to the globe box and dry THF (1 ml) was added to it. The tube was capped and taken out from the glove box. Triethylamine (216 uL, 1.55 mmol) was injected in it and trimethylsilylacetylene (176 uL, 1.25 mmol) was added to the reaction mixture slowly. The reaction mixture was stirred at room temperature for 24 hours. Upon completion, the reaction mixture was diluted with ethyl acetate, filtered through a silica gel plug, rinsed with ethyl acetate, and concentrated in vacuo. The crude reaction mixture was purified on silica gel. The internal alkyne was dissolved with anhydrous THF (1 mL), and TBAF (1.5 mL, 1M in THF) was added. The resulting mixture was stirred at room temperature overnight. Upon completion, the reaction mixture was diluted with ethyl acetate, filtered through a silica gel plug, rinsed with ethyl acetate, and concentrated in vacuo. The crude reaction mixture was purified on silica gel to give the desired product as a brown-yellow oil.}
