**1.1 Synthesis of the central cores**

The synthesis of the target compounds Dm-n utilized the corresponding both symmetrical cores 1/m and 2/m and non-symmetrical core 3/3, respectively (Figure S1). Furthermore, the central cores were substituted with a series of versatile lengthening arms 4/n-10 (Figure S1), to obtain broad series of target dimeric materials Dm-n with a different molecular structure for detailed physical investigations.

Synthesis of the bent-core units 1/m and 2/m

In the preliminary contribution, the synthetic access to the cores 1/3 and 2/3 has been described. The cores 1/m and 2/m, which differ in the length of the alkylene spacer between
the two aromatic units only, have been obtained analogously (see Scheme S1). In the first step, the hydroxyl group of the dibenzyl protected phloroglucinol 1 was alkylated with \(\omega\)-tetrahydropyranxyloxy-substituted alkyl iodide in \(N,N\)-dimethylformamide (DMF) in the presence of potassium carbonate to yield compounds 12 (86%) (Scheme S1). Standard acid catalysed deprotection of the THP-protecting group released the terminal hydroxyl group and provided alcohols 13. To join the second aromatic unit, the hydroxyl group of 13 was subsequently transformed to the corresponding alkyl bromides by the reaction with \(\text{CBr}_4/\text{Ph}_3\text{P}\). The second central core – methoxymethyl (MOM) protected pyrrogallol 15 was then alkylated with the bromides as above to yield the intermediates 16. The MOM protecting groups were removed by an acid catalysed hydrolysis to yield the dibenzyl protected central core 1. The tetraphenol based cores 2 were obtained by catalytic hydrogenolysis of 1.

Synthesis of the bent-core unit 3/3

Synthesis of bent-core unit 3/3 required two intermediates derived from substituted phloroglucinol and pyrogallol (Scheme S2). Synthesis of the former started from the benzyl bisbenzoate 17\textsuperscript{S5} which was subjected to a partial deprotection of a benzoate group by a base-catalysed reesterification with methanol to yield 18. To obtain the second core 23 we utilized transformations of the known 2-iodoresorcinol (19)\textsuperscript{S6}. A successive monoprotection of one of its hydroxylic group by benzylation with benzyl bromide yielded compound 20, which was further protected with methoxymethyl (MOM) group using methoxymethyl chloride in basic medium. Lithiation of the protected derivative 21 with butyllithium and trapping the formed lithium salt with trimethyl borate yielded after hydrolysis the corresponding boronic acid 22. Hydrogen peroxide oxidation of 22 left the target intermediate 23. The bis-protected phloroglucinol 18 was then alkylated with THP-protected 3-iodopropanol (Scheme S2), the formed compound 24 was then subjected to deprotection of the hydroxy group and the released hydroxy group of compound 25 was subsequently transformed to the bromo compound 26. Finally the protected pyrogallol 23 was alkylated with the alkyl bromide 26 which yielded after an aqueous workup the target bent-core unit 3/3.
1.2 Synthesis of the series of dimers

Synthesis of dimers differing in the length of alkylene spacer

The first studied series of dimers was prepared by sequential acylation of the core 1/m with acid chloride of acid 4/12 in the presence of 4-dimethylaminopyridine (DMAP) (Scheme S3). After the first acylation, the benzyl groups in intermediates 27/m were removed by catalytic hydrogenation and the released hydroxylic groups of compounds 28/m were acylated.
with the acid chloride of 4/12 to yield symmetric dimers D2-12, D3-12, D4-12, D5-12, D6-12, D8-12, and D12-12).

Synthesis of dimers differing in the length of the terminal chain

In the preliminary paper, we have investigated the role of the terminal chain length in materials with a three-carbon alkylene spacer. In the continuation analogous series of dimers (D4-n) has been synthesised. For this purpose, we utilized the bent core 2/4 which was acylated with an excess of acid chlorides of acids 4/n under the same conditions as for dimers Dm-12 (Scheme S4).

Scheme S4 Synthesis of series of dimers D4-n.

Synthesis of dimers with different lengthening arms in the bent-core units

In the design of non-symmetric bent-core dimers, we intended to change the dodecyl alkyl chain for a polyfluoroalkyl terminal unit. In the first aspect we kept the dodecyl alkyl chains in the upper bent-unit and changed the terminal chains in the bottom unit. Their synthesis was based on utilization of the intermediates 28/m (m=2,3,4,5) (Scheme S5) which were acylated with acid chloride of acid 5 to yield the dimers Dm12-12FF. Furthermore, all the dodecyl units were replaced for the fluorinated ones (dimers Dm-FF-FF). The synthesis was achieved by a quadruple acylation of the bent-core unit 2/m (m=3,4) (Scheme S5). The non-symmetrical dimers along the vertical axis D3-12F-12F and D3-11F-11F were obtained by a step wise acylation of the bent-core unit 3/3 analogously as for materials of series Dm-12. In the first step, by acylation with acid 5 (Scheme S6), the polyfluorinated side arms were introduced, then the protecting benzyl groups were removed from the intermediate 29 by catalytic hydrogenation, and the released hydroxyl groups of 30 were acylated with acid chloride of acid 4/12 and 7, respectively. The dimer D3-SiF-SiF possessing siloxane units in
left arms and polyfluoroalkyl chains in the right arms of the dimer was prepared by a radical silylation of the undecenyl chain terminated dimer D3-11F-11F (Scheme S7).

Synthesis of dimers differing in the number of terminal chains

Synthesis was been achieved by acylation of the bent cores 2/m (m=3,4) with acid 6 to yield the polycatenar dimers Dm-12/3 (m=3,4) (Scheme S8).

Scheme S8 Synthesis of polycatenar dimer D3-12/3.
Synthesis of dimers with modified linking groups in the lengthening arms

The series of dimers, in which the linking groups in the outer position of the lengthening arms were modified, was synthesised by a quadruple acylation of the bent-core unit $2/m$ $(m=3,4)$ with acid chlorides of acids $8-10$ yielding dimers $\text{Dm-12/inv}$, $\text{Dm-12/azo}$, and $\text{Dm-12/Ph2}$, where inv denotes the inverted orientation of the carboxylic group ($Z=\text{OOC}$), azo stands for an azo linking group ($Z = \text{N=N}$), and Ph2 means the presence of a biphenyl unit due to absence of any linking group ($Z = -$) (Scheme S9).

Characterisation
The structures of all intermediates and products were confirmed by proton (\(^1\)H) and carbon (\(^{13}\)C) nuclear magnetic resonance (NMR) spectroscopy (Varian Gemini 300 HC instrument), deuteriochloroform (CDCl\(_3\)) and methanol-\(d_4\), resp., were used as solvents and signals of the solvents served as internal standards, \(J\) values are given in Hz. \(^{19}\)F NMR spectra are referenced to CFCl\(_3\). Purity of all final compounds was verified by high performance liquid chromatography (HPLC) analysis (Luna Silica 5 \(\mu\)m, 150 \(\times\) 4.6 mm) and found >99.8%. The HR-MS of dimers has been performed on spectrometer LTQ Orbitrap Velos, hybrid ion-trap-orbitrap (Thermo Scientific), positive electrospray. Column chromatography was carried out using Merck Kieselgel 60 (60–100 \(\mu\)m) in indicated solvents.

General methods of synthesis

**Method 1 Alkylation of phenols**
Alkyl bromide (10 mmol) was added to a mixture of phenol (11 mmol) and freshly fused potassium carbonate (11 mmol) in dry DMF (50 ml). The mixture was stirred and heated to 70°C for 18 h in an argon atmosphere. After cooling to room temperature, it was diluted with water (200 ml) and extracted with toluene and ethyl acetate, respectively (3 \(\times\) 50 ml). The combined organic solution was washed with brine (30 ml) and dried with anhydrous magnesium sulphate. The solvent was removed and the crude product was purified by column chromatography or crystallisation.

**Method 2 Deprotection of the THP group**
A catalytic amount of TsOH was added into a solution of protected alcohol (1.0 g) in a mixture of methanol (20 ml) and dichloromethane (45 ml). After stirring at room temperature for 24 h, the mixture was evaporated and the product was isolated by column chromatography (usually toluene/tert-butyl methyl ether (8/1)) and crystallisation, respectively.

**Method 3 Synthesis of alkyl bromides by the means of Ph\(_3\)P/CBr\(_4\)**
Tetrabromomethane (0.5 g; 1.5 mmol) and triphenylphospine (420 mg; 1.6 mmol) were added to a solution of alcohol (1 mmol) in dry dichlormethane (50 ml) at 0°C. The mixture was stirred for 30 min at 0°C, 30 min at room temperature, and then evaporated. The crude product was purified by column chromatography (usually hexane/ethyl acetate (10/1)).

**Method 4 Deprotection of the MOM groups**
To a solution of the MOM ether (1 mmol) in methanol (25 ml), 35% aq. hydrochloric acid (0.4 ml; 4 mmol) and water (0.4 ml) were added. The mixture was stirred under heating to 60°C for 1.5 h. After cooling to room temperature it was diluted with water (50 ml), and extracted with ethyl acetate (3 \(\times\) 25 ml). The combined extracts were washed with saturated aqueous solution of sodium hydrogen carbonate (10 ml), brine (10 ml), and dried with...
anhydrous magnesium sulphate. After removing the solvent, the product was obtained by column chromatography (toluene/tert-butyl methyl ether 12/1).

**Method 5 Deprotection of the benzyl group**

To a slurry of benzyl derivative (0.5 g) in ethyl acetate (50 ml), 10% Pd/C (0.05 g) was added and the mixture was hydrogenated in a Parr apparatus at room temperature for 20 h. The catalyst was filtered off and washed with ethyl acetate (2 × 15 ml), the filtrate was evaporated and the product purified by column chromatography.

**Method 6 General method of preparation of acid chlorides**

To a slurry of carboxylic acid (1 mmol) in dry dichloromethane (20 ml), oxalyl chloride (0.42 ml; 5 mmol) and a drop of DMF were added. The mixture was stirred at room temperature for 24 h and evaporated. To the residue was added toluene (10 ml) and the mixture was evaporated. The acid chloride was used immediately in the acylation reaction.

**Method 7 Acylation of phenols with acid chlorides**

To a solution of phenol (1 mmol) and 4-dimethylaminopyridine (DMAP) (171 mg; 1.4 mmol) in dichloromethane (30 ml), a solution of freshly prepared acid chloride (1.4 mmol) (in case of diols and tetraols 6–8 equivalents of acid chloride) in dichloromethane (20 ml) was added. The mixture was heated to boiling under stirring for 3-8 h. After cooling to room temperature, water (1 ml) was added and stirred overnight. The organic layer was separated and the aqueous layer was extracted with dichloromethane (2 × 15 ml). The combined organic solution was dried with anhydrous magnesium sulphate, filtered and the filtrate was evaporated. The crude product was purified by column chromatography and crystallisation.

**Method 8 Introduction of the MEM protecting group**

To a slurry of sodium hydride (60% in oil) (0.52 g; 13 mmol) (washed in advance with hexane (3 × 10 ml)) in dry DMF (8 ml) cooled to 0°C, a solution of phenol (10 mmol) in dry DMF (5 ml) was added within 0.5 h. The mixture was stirred for 0.5 h at room temperature, cooled back to 0°C, and chloromethyl methyl ether (0.9 ml; 11.5 mmol) was added. The mixture was stirred at room temperature for 1.5 h and poured on a cold saturated solution of ammonium chloride (20 ml). The product was extracted with tert-butyl methyl ether (3 × 15 ml), the combined extracts were washed with water (10 ml), brine (10 ml), and dried with anhydrous magnesium sulphate. The solvent was evaporated and the residue was purified by column chromatography.
