All reagents were purchased from Aladdin Co., Alfa Aesar Co., and Aldrich Chemical Co., and used as received without further purification. Compounds 1, 2, 4, 6, 5b and 8 and were synthesized according to previous reported procedures.1-4 The synthetic routes of the monomers and copolymers are shown in Scheme S1. The detailed synthetic processes are as follows.

Compound 1 (6.42g, 10.0 mmol), compound 2 (9.68g, 20.0 mmol) and Pd(PPh$_3$)$_4$ (73 mg, 0.1 mmol) were first added to a degassed solution of toluene (20 mL) and Na$_2$CO$_3$ aqueous solution (2 M, 5 mL) in a 50 mL Schlenk flask. The reaction was stirred at 110 °C for 24 h. The reaction mixture was then cooled down to room temperature. Dichloromethane (DCM) and water was added for extraction. The organic layer was washed with brine and water, and then dried with anhydrous

3. Measurements and characterizations

¹H and ¹³C NMR spectra were recorded on a Bruker Avance-400 spectrometer with CDCl₃ or CD₃OD as the solvent. The chemical shifts were reported as δ value (ppm) relative to an internal tetramethylsilane (TMS) standard. The elemental analysis was performed on a Thermo Electron SPA Flash EA 1112 series analyzer. UV-vis spectra were obtained on a Hitachi U2910 spectrophotometer. Cyclic voltammetry measurements were made on a CHI660 potentiostat/galvanostat electrochemical workstation at a scan rate of 50 mV s⁻¹, with a platinum wire counter electrode and an Ag/AgCl reference electrode in an anhydrous and nitrogen-saturated 0.1 mol L⁻¹ acetonitrile solution of tetrabutylammonium perchlorate. The UPS measurements were conducted on a Thermo Scientific ESCALAB 250Xi photoelectron spectroscope. AFM images were obtained by using a Bruker Inova atomic microscope in tapping
mode. The TEM images were obtained by using a ZEISS LIBRA 200 FE transmission electron microscope.

Device fabrication: The device structure was ITO/PEDOT:PSS/active layer/CIL/Al. The pre-patterned ITO glass substrates (sheet resistance = 15 Ω sq⁻¹) were ultrasonicated in detergent, deionized water, acetone, and isopropanol, subsequently. After dried by high-pressure air flow, the substrates were further cleaned by UV-ozone exposure for 30 min. After filtration through a 0.45 μm filter, PEDOT:PSS (Bay P VP AI 4083, Bayer AG) was spin-coated at 5000 rpm for 60 s to form a thickness of 35 nm thin layer on the cleaned ITO substrate, and baked on a hot plate at 150 °C for about 15 min. A blend film of PBDTS-TDZ:IT-4F (1:1 w/w) was prepared by spin-coating its mixed solvent of MeTHF/1,8-diiodoctane (DIO) (99.5:0.5, v/v) solution (concentration: 15 mg mL⁻¹) at 2000 rpm for 60 s, followed by baked on a hot plate at 100 °C for 5 min. The thickness of the active layer was around 100 nm, which was detected by a Dektak 6 M surface profilometer. A thin layer of the CILs was prepared by spin-coating their solutions (0.5-5 mg/mL in MeOH) at 4000 rpm to form different film thicknesses. Finally, Al (100 nm) was deposited on the top of surface in a high vacuum chamber (~10⁻⁴ Pa). The device area was 4.0 mm².

Device characterization: The I-V characterization of the devices was carried out on a computer-controlled Keithley 2400 Source Measurement system under 100 mW cm⁻² AM 1.5G light source, provided by an AAA solar simulator (XES-70S1, SAN-EI Electric Co., Ltd), which was calibrated with a standard Si solar cell (AK-200, KONICA MINOLTA, INC.). The EQE values were measured with a Newport QE test
system (Newport Co., Ltd.) during illumination with monochromatic light from a xenon lamp, monitored by a traceable silicon photodiode. The AC impedances of the devices were characterized with CHI604E electrochemical workstation at the impedance mode under AM 1.5 G 100 mW cm$^{-2}$ illumination.
