Figure S1. The bulk-shaped carbonized lignin.

Figure S2. Resistance measurement of (a) bulk-shaped carbonized lignin (80 mm x 24 mm x 10 mm) and (b)
CL/PDMS composite (20 mm x 20 mm x 1 mm).

Figure S3. FTIR spectra of lignin and carbonized lignin (a), the amplified spectrum of carbonized lignin (b).

Figure S4. Relative change of resistance of CL/PDMS with different CL. (content: the CL content in PDMS, that is, the total content is 25.9%, 28.6%, 31.0%, 33.3%, respectively.)

Figure S5. The stress-strain curve of the CL/PDMS composite under cyclic pressure.
The derivation of tunnel resistance equation:

\[ R_{\text{tunnel}} = \frac{V}{a J} = \frac{2}{3} \frac{h^2 s}{ae^2 \sqrt{2m\phi}} \exp\left(\frac{4\pi}{h} \sqrt{2m\phi} s \right) \]

Equation (1) is derived from the equation (25) in the reference 35 and the process is as follows:

Based on the equation

\[ J = \frac{3\sqrt{2m\phi e^2 V}}{2s} \exp\left(-\frac{4\pi s}{h} \sqrt{2m\phi} \right) \quad \text{(the equation (25) in the reference 35)} \]

the area resistance \( R_{\text{tunnel}} = V/(aJ) \) can be given by

\[ R_{\text{tunnel}} = \frac{V}{a J} = \frac{2}{3} \frac{h^2 s}{ae^2 \sqrt{2m\phi}} \exp\left(\frac{4\pi}{h} \sqrt{2m\phi} s \right) \]

where \( a \) is cross-sectional area of tunnel, \( V \) is the potential difference between the conductive particle, \( J \) is the tunneling current density, \( e \) is the quantum of electricity, \( m \) is the mass of electron, \( h \) is the Planck’s constant, \( s \) is the distance between CLs in the insulating material and \( \phi \) is the height of potential barrier. This equation is similar to that in the report.
The equation (1) is suitable for the description of tunneling effect of the CL/PDMS sensor under the condition of low voltage. The reason is that there are huge number of CL particles across the composite and the voltage applied to the composite is only 1V, therefore, the voltage between two conductive particles can be considered to be close to 0V.
