Electronic Supplementary Information For

Toward ultrasensitive and fast colorimetric detection of indoor formaldehyde across the visible region using cetyltrimethylammonium chloride-capped bone-shaped gold nanorods as “chromophores”

Table of contents

S1. Photograph of the setup for air sample collection
S2. UV-vis spectra of the bone-shaped Au NRs capped with CTAB and CTAC.
S3. A typical TEM image and UV–vis absorption spectra of routine Au NRs.
S4. Photograph (a) of routine Au NRs-Tollens reagent mixture after incubation with different concentration of HCHO.
Figure S1. Photograph of the setup for air sample collection.
Figure S2. UV-vis spectra of the bone-shaped Au NRs capped with CTAB and CTAC.
Figure S3. A typical TEM image and UV–vis absorption spectra of routine Au NRs.
Figure S4. Photograph (a) of routine Au NRs-Tollens reagent mixture after incubation with different concentration of HCHO. (From left to right: the concentration of HCHO are 0, 0.1, 0.2, 0.5, 1, 2.5, 7.5, 15, 25, 30, 40, 50, 75 μM) and their corresponding UV-vis spectrum (from right to left).
