General Methods

All reactions were performed using standard Schlenk techniques or in a nitrogen-filled glovebox (GS Glovebox Systemtechnik). Glassware was dried in a hot oven at 120 °C overnight before use. NMR spectra were recorded at ambient temperature using CDCl$_3$ or C$_6$D$_6$ as solvent, with proton, carbon, and fluorine resonances at 400/300/250, 101/75/63 and 235 MHz, respectively. All NMR data are reported in parts per million (ppm,) and coupling constants in Hertz (Hz). The $^1$H and $^{13}$C NMR spectra were referenced to the solvent peak: CDCl$_3$ (7.27 ppm in $^1$H and 77.0 ppm in $^{13}$C), C$_6$D$_6$ (δ 7.16 ppm in $^1$H and 128.39 ppm in $^{13}$C). $^{19}$F NMR spectra were externally referenced to CFCl$_3$ (0.00 ppm). Coupling constants are reported in hertz (Hz). Elemental analyses were performed on an Elementar vario MICRO-cube elemental analyzer. Mass spectrometric data were acquired on a GC-MS Agilent 5977B MSD. The MS ionization was achieved by EI$^+$. Melting points were measured on a Mettler FP 61. Infrared spectra were recorded on BrukerVertex 70 Spectrometer with Universal ATR Sampling Accessory. Bands are given in cm$^{-1}$ with intensities (vs very strong, s strong, m medium, w weak). Melting points were measured on a Mettler Toledo MP70. GC analyses were carried out using an HP-5 capillary column (Phenyl methyl siloxane, 30 m × 320 × 0.25, 100/2.3-30-300/3, 2 min at 60 °C, heating rate 30 °C/min, 3 or 10 min at 300 °C). Column chromatography was performed on a CombiFlash Companion (Isco) or on a Reveleisis X2 (BUCHI) Flash Chromatography-System using Reveleisis packed columns (12 g). Solvents were dried over molecular sieves or obtained from the solvent-drying system (Braun SPS System) and stored over 3 or 4 Å molecular sieves. Molecular sieves were activated in the microwave prior to use. All solvents were degassed by bubbling argon trough the solvent. {([IPr]PdCl$_2$)$_2$ (UMICORE CX41), [Pd(allyl)Cl]$_2$ and PdBr$_2$ were donated by UMICORE. All other compounds were bought from commercial sources and used without further purification.
3 Screening Tables of the reaction conditions

3.1 Suzuki-Miyaura Coupling

**General Procedure for the reaction screening condition of Suzuki-Miyaura Coupling of p-chlorotoluene with phenylboronic acid**

An oven dried crimp cap vial equipped with a Teflon coated magnetic stirring bar was charged with base and phenylboronic acid. The vial was sealed, and evacuated and backfilled with argon three times. p-Chlorotoluene (65 mg, 0.5 mmol, 1 equiv.) was added via syringe. Degassed solvent (1 mL) and n-tetrade can were added to the reaction as GC internal standard. Then, a freshly prepared stock solution of Pd-1 (0.025 M in toluene, 0.1 mL, 0.0025 mmol, 0.005 equiv.) was added via syringe and the reaction was stirred at the temperature and time reported in the table S1. Then, the reaction was analysed by GC.

3.3 Copper-free Sonogashira coupling of aryl halides

**General procedure for the reaction condition of Sonogashira coupling of aryl halides with phenyl acetylene**

In a nitrogen filled glovebox, an oven dried crimp cap vial equipped with a Teflon coated magnetic stirring bar was charged with Pd-1 (6.2 mg, 0.005 mmol, 0.005 equiv.). The vial was removed from the glovebox and the complex was dissolved in dry and degassed solvent (2 mL). After, the aryl halide (1 mmol, 1 equiv.) followed by phenylacetylene (1.2 mmol, 1.2 equiv.), base and n-dodecane were added. The reaction was stirred at the temperature reported in the tables S3-S4 for 16 h. Then, the reaction was analysed by GC.

* Reaction conditions: 4-bromofluorobenzene (1 mmol), phenylacetylene (1.2 mmol), base (x mmol), Pd-1 (0.5 mol%), solvent (2 mL), 40 °C, 16 h. Yield determined by GC using n-dodecane as internal standard.
4 Synthetic Procedures

4.1 Synthesis of [(IPr)PdI]₂ (Pd-1)

[(IPr)PdI]₂ (1.37 g, 0.91 mmol, 1 eq.) were weighted into a Schlenk flask and the air was replaced by argon. The complex was dissolved in 18 mL of dry and degassed toluene. In a 10 mL crimp cap vial, potassium hydroxide (102 mg, 1.82 mmol, 2 eq.) was dissolved in 13 mL dry and degassed methanol. This solution was added to the stirred solution of the Pd-complex and the mixture stirred for 6 h at ambient temperature. The volatiles were removed under vacuo and the remaining greenish solid was extracted with toluene (3x9 mL). The combined organic solutions were dried under vacuo to obtain [(IPr)PdI]₂ (678 mg, 60%) as a dark green solid. Single crystals of Pd-1 suitable for X-ray diffraction were obtained by evaporation of toluene.

¹H NMR (300 MHz, C₆D₆): δ = 7.27 (t, J=7.9 Hz, 4 H), 7.10 (d, J=7.5 Hz, 4 H), 6.45 (s, 4 H), 2.77 (spt, J=6.8 Hz, 4 H), 1.41 (d, J=7.0 Hz, 24 H), 1.03 (d, J=6.8 Hz, 24 H) ppm; ¹³C-NMR (101 MHz, C₆D₆): δ =184.3, 146.2, 138.3, 130.2, 124.7, 122.7, 29.1, 25.2, 24.8 ppm; EA: Anal. Calc. For C₅₄H₇₇I₂N₄Pd₂: C, 52.06%; H, 5.99 %; N, 4.50%, Found: C, 52.44%; H, 5.82%; N, 4.65%.

4.2 Synthesis of [(IPr)PdI]₂ [CAS 1233644-81-9] (Pd-2)

A 100 mL crimp cap vial was charged with [(IPr)PdCl₂]₂ (567 mg, 0.5 mmol, 1 eq.) and potassium iodide (3.35 g, 20 mmol, 40 eq.) and suspended in 50 mL acetone. The mixture was
heated to 50 °C and stirred for 96 h. Then, the solution was filtered, and volatiles were removed under reduced pressure. The remaining brown solid was dissolved in 50 mL dichloromethane and washed three times with 10 mL of water. The aqueous layer was extracted three times with 20 mL dichloromethane and the combined organic layers were dried over magnesium sulfate. The removal of volatiles under vacuum yielded [[(IPr)PdI]2] (747 mg, 99%) as an orange solid. The NMR data match with those previously reported.  

1H NMR (300 MHz, CDCl3): δ = 7.52 (t, J=7.7 Hz, 3 H), 7.22 - 7.40 (m, 8 H, overlapping with CDCl3), 3.15 - 3.45 (m, 4 H), 2.60 - 2.90 (m, 4 H), 1.48 (d, J=6.6 Hz, 12 H), 1.25 (d, J=6.6 Hz, 12 H), 1.07 (d, J=6.6 Hz, 12 H), 0.94 (d, J=6.8 Hz, 12 H) ppm; 13C NMR (75 MHz, CDCl3): δ = 165.5, 146.4, 146.0, 135.4, 130.3, 125.4, 124.7, 124.3, 29.1, 26.5, 24.0 ppm; mp: 282 °C (from chloroform) (lit., >280 °C); IR (ATR mode): 2966 (w), 2868 (w), 1460 (w), 1443 (w), 1402 (w), 1385 (w), 1364 (w), 1328 (w), 1264 (s), 1204 (w), 1180 (w), 1121 (w), 1057 (w), 966 (w), 941 (w), 895 (w), 801 (w), 732 (vs), 702 (vs), 636 (w), 548 (w) cm⁻¹; EA: Anal. 4.3 Synthesis of [(IPr)PdBr]2 [1228877-10-8] (Pd-3) and trans-(IPr)2PdBr2

Method A:
A 100 mL crimp cap vial was charged with [(IPr)PdCl]2 (1.13 g, 1 mmol, 1 eq.) and potassium bromide (4.76 g, 40 mmol, 40 eq.) and suspended in 50 mL acetone. The mixture was heated to 50 °C and stirred for 7 days. Then, the solution was filtrated, and volatiles were removed under reduced pressure. The remaining brown solid was dissolved in 50 mL of dichloromethane and washed three times with 10 mL of water. The aqueous layer was extracted three times with 20 mL of dichloromethane and the combined organic layers were dried over magnesium sulfate. The removal of volatiles under vacuum yielded [[(IPr)PdBr]2] (1.30 g, 99%) as an orange solid.
**Method B:**

Under an argon atmosphere, an oven dry Schlenk tube was charged with palladium(II) bromide (226 mg, 1 mmol, 1 equiv.). To the solid, 6 mL of acetone was added and the suspension was heated to 40 °C for 15 h. After evaporating the solvent, the residual solid was heated to 120 °C for 2 h under high vacuum. Then, the solid was cooled to room temperature and 4 ml of dry THF was added. After, a solution of IPr (289 mg, 1 mmol, 1 equiv.) in 6 mL of dry THF was added. The dark red reaction mixture was stirred for 3 h at ambient temperature. After, the solution was filtered through celite and washed with several portions of THF until the filtrate was colourless. After the removal of volatiles a dark red solid afforded which was purified by flash chromatography (cyclohexane/ethyl acetate 9:1) yielding Pd-3 (455 mg, 69%) as the orange solid and trans-(IPr)2PdBr2 as byproduct (123 mg, 6%) as orange solid. Single crystals of trans-(IPr)2PdBr2 suitable for X-ray diffraction were obtained by slow evaporation of ethyl acetate.

The NMR data match with those previously reported.²

### 4.4 Synthesis of \((\text{IPr})_2\text{PdHBr}\) (Pd-4)

![Diagram of Pd-4](image)

Under an argon atmosphere, an oven dry Schlenk tube was charged with \([(\text{IPr})\text{PdBr}_2]_2\) (262 mg, 0.2 mmol, 1 equiv.). The solid was dissolved in 4 ml of dry and degassed toluene and a solution of KOH (22.4 mg, 0.4 mmol, 2 equiv.) in 2 mL of dry and degassed MeOH was added. The mixture was stirred for 16 hours and the solvent was removed. The crude solid was extracted two times with 4 mL of toluene and the volatiles were removed under vacuum. Analysis by \(^1\text{H}\) NMR of the solid in C₆D₆ showed to be mainly starting material and Pd-4. The solid was re-dissolved in toluene and layered with acetone to obtain brownish crystals of Pd-4.

\[^1\text{H}\] NMR (300 MHz, C₆D₆): δ = 7.26 (t, J=8.00 Hz, 2 H), 7.05 (d, J=7.54 Hz, 9 H), 6.45 (s, 4 H), 2.97 - 3.23 (m, 8 H), 1.13 (d, J=6.62 Hz, 24 H), 1.00 (d, J=6.85 Hz, 24 H), -13.97 (s, 1 H) ppm; \[^{13}\text{C}\] NMR (75 MHz, C₆D₆): δ = 188.1, 146.7, 137.8, 129.7, 124.5, 124.2, 28.8, 26.3, 24.0 ppm.

### 4.5 Synthesis of \((\eta^3\text{-allyl})/(\eta^5\text{-cyclopentadienyl})\text{palladium}\)

Under an argon atmosphere, allylpalladium chloride dimer (1.12 g, 3 mmol, 1 equiv.) was dissolved in 24 mL of dry and degassed THF and cooled to -60 °C. To the stirred solution, a solution of sodium cyclopentadienyl (2 M in THF, 3 mL, 6 mmol, 2 equiv.) was added slowly. The mixture was then allowed to warm to room temperature and stirred for an additional 30 min. After, the solvent was removed the remaining solid was extracted with 42 mL of cyclohexane and filtrated by cannula. The residual solid was washed once with 15 mL cyclohexane. The combined organic solutions were dried under vacuum yielding \((\eta^3\text{-allyl})/(\eta^5\text{-cyclopentadienyl})\text{palladium}\) (1.20 g, 95%) of a volatile red solid.

The NMR data match with those previously reported.
\[^1\text{H NMR}\] (300 MHz, C\textsubscript{6}D\textsubscript{6}): δ = 5.86 (s, 5 H), 4.53 - 4.66 (m, 1 H), 3.42 (d, J=6.1 Hz, 2 H), 2.10 (d, J=10.6 Hz, 2 H) ppm; \[^{13}\text{C NMR}\] (75 MHz, C\textsubscript{6}D\textsubscript{6}): δ = 94.9, 94.8, 46.0 ppm.

4.6 Synthesis of [(IPr)\textsubscript{2}Pd]

In an oven-dried Schlenk tube, (η\textsuperscript{3}-allyl)(η\textsuperscript{5}-cyclopentadienyl)palladium (109 mg, 0.52 mmol, 1.03 equiv.) was dissolved in 2 mL of dry and degassed cyclohexane. Then a solution of IPr (606 mg, 1.56 mmol, 3.12 equiv.) in 20 mL of dry and degassed cyclohexane was added over 30 min. The resulting reaction mixture was stirred for 18 h at ambient temperature. After removal of volatiles, the residual solid was dissolved in 6 mL of dry and degassed toluene and the product was precipitated by adding 30 mL of dry and degassed MeOH. The solution was filtrated, and the orange solid was washed with dry and degassed MeOH (2x3 mL) and dried under high vacuum to afford [(IPr)\textsubscript{2}Pd] (190 mg, 43%) [(IPr)\textsubscript{2}Pd] as an orange solid. The spectroscopic data match those reported in literature. \(^4\)

\[^1\text{H NMR}\] (400 MHz, C\textsubscript{6}D\textsubscript{6}): δ = 7.30 (t, J=7.6 Hz, 3 H), 7.08 (d, J=7.8 Hz, 8 H), 6.27 (s, 4 H), 2.77 - 2.95 (m, 8 H), 1.19 (d, J=6.8 Hz, 24 H), 1.11 (d, J=7.1 Hz, 24 H) ppm; \[^{13}\text{C NMR}\] (75 MHz, C\textsubscript{6}D\textsubscript{6}): δ = 199.6, 146.4, 139.5, 128.9, 123.7, 121.6, 29.0, 25.5, 24.4 ppm; \textbf{EA}: Anal. 4.7 Comproportionation attempt between [(IPr)\textsubscript{2}Pd] and PdBr\textsubscript{2}

Under an argon atmosphere, an oven dry Schlenk tube was charged with palladium(II) bromide (20.6 mg, 0.077 mmol, 1.2 equiv.). To the solid, 1 mL of acetone was added and the suspension was heated to 40 °C for 16 h. After evaporating the solvent, the residual solid was heated to 120 °C for 2 h under high vacuum. Then, the solid was cooled to room temperature and 1 ml of dry and degassed toluene was added. After, a solution of [(IPr)\textsubscript{2}Pd] (57 mg, 0.064 mmol, 1 equiv.) in 3 mL of dry and degassed toluene was added. The mixture was stirred for 24 h at ambient temperature. After, the solution was filtered through cannula and the remaining black solid was washed with 3 mL of dry and degassed toluene. The reunited organic solutions were dried. Isolated trans-(IPr)\textsubscript{2}PdBr\textsubscript{2} (43 mg, 64%) as orange solid. The NMR spectra of the solid were consistent with the previously reported spectra of trans-(IPr)\textsubscript{2}PdBr\textsubscript{2}.

General Procedure for the Suzuki-Miyaura Coupling of Aryl Chlorides

An oven dried crimp cap vial equipped with a Teflon coated magnetic stirring bar was charged with caesium carbonate (253 mg, 0.77 mmol, 1.4 equiv.), phenylboronic acid (81 mg, 0.66 mmol, 1.2 equiv.) and aryl chloride (0.55 mmol, 1 equiv.) if solid. The vial was sealed, and evacuated and backfilled with argon three times. Aryl chloride (0.55 mmol, 1 equiv.) was added via syringe if liquid. Degassed EtOH (1 mL) was added and the mixture was heated to 40 °C. Then, a freshly prepared stock solution of Pd-1 (0.0275 M in toluene, 0.1 mL, 0.00275 mmol, 0.005 equiv.) was added via syringe and the reaction was stirred for 4 h at 40 °C unless otherwise stated. The reaction solution was diluted with 10 mL ethyl acetate and washed with 10 mL water. Then the aqueous layer was extracted with ethyl acetate 2x10 mL. The combined organic layers were washed with 10 mL of brine and dried over MgSO\textsubscript{4}. Afterwards the crude reaction mixture was purified by flash chromatography.
4.8  Synthesis of 1-methyl-4-phenylbenzene (3aa) [CAS 644-08-6]

The compound was synthesised according to the general procedure. The crude reaction mixture was purified by flash chromatography using cyclohexane yielding 3aa (85 mg, 92%) as colourless solid. The NMR data match with those previously reported.5

**General procedure for the Buchwald-Hartwig amination of aryl chlorides**

An oven dried crimp cap vial equipped with a Teflon coated magnetic stirring bar was charged sodium tert-butoxide (147 mg, 1.5 mmol, 1.5 equiv.). The vial was sealed, and evacuated and backfilled with argon three times. Then, a freshly prepared stock solution of Pd-1 (0.005 M in THF, 1 mL, 0.005 mmol, 0.005 equiv.) was added via syringe followed by aryl chloride (1 mmol, 1 equiv.) and morpholine (93 µL 1.05 mmol, 1.05 equiv.). The reaction mixture was stirred for 2 h at 40 °C. The reaction solution was diluted with 10 mL ethyl acetate and washed with 10 mL water. Then the aqueous layer was extracted with ethyl acetate 2x10 mL. The combined organic layers were washed with 10 mL of brine and dried over MgSO$_4$. Afterwards the crude reaction mixture was purified by flash chromatography.

The vial was removed from the glovebox and the complex was dissolved in dry and degassed MeCN (2 mL). After, the aryl iodide (1 mmol, 1 equiv.) was added via syringe followed by triethylamine (279 µL, 2 mmol, 2 equiv.) and 134 µL phenylacetylene (1.2 mmol, 1.2 equiv.). The reaction mixture was stirred for 16 h at 40 °C. After, the reaction solution was diluted with 10 mL ethyl acetate and washed with 10 mL water. Then the aqueous layer was extracted with ethyl acetate 2x10 mL. The combined organic layers were washed with 10 mL of brine and dried over MgSO\textsubscript{4}. Afterwards the crude reaction mixture was purified by flash chromatography.

\textbf{4.31 Synthesis 1,2-diphenylethyne (8aa) [CAS 501-65-5]}

\[ \text{Ph} \]
The compound was synthesised according to the general procedure. The crude reaction mixture was purified by flash chromatography using cyclohexane yielding **8aa** (166 mg, 93%) as colourless solid.

The NMR data match with those previously reported.\(^{39}\)

6 Crystallographic Data

Experimental: A suitable crystal was selected and mounted on a SuperNova, Single source at offset, Atlas diffractometer. The crystal was kept at 100 K during data collection. Using Olex2, the structure was solved with the ShelXT structure solution program using Intrinsic Phasing and refined with the ShelXL refinement package using Least Squares minimisation.
