1. General information

Perfluoroalkanesulfinates (RfSO2Na) were prepared according to the literature procedure.[1] Other chemical reagents are obtained from commercial suppliers and used without further purification. All reactions were carried out with dry solvents under anhydrous conditions, unless otherwise noted. All known compounds are identified by appropriate technique such as $^1$H NMR, $^{13}$C NMR, $^{19}$F NMR and compared with previously reported data. All unknown compounds are characterized by $^1$H NMR, $^{13}$C NMR, $^{19}$F NMR and HRMS. Analytical thin-layer chromatography is performed on glass plates precoated with silica gel impregnated with a fluorescent indicator (254 nm), and the plates are visualized by exposure to ultraviolet light. $^1$H, $^{13}$C and $^{19}$F NMR spectra were recorded on a 500 MHz Bruker DRX 500 and tetramethylsilane (TMS) was used as a reference. Chemical shifts were reported in parts per million (ppm), and the residual solvent peak was used as an internal reference: proton (chloroform δ 7.26, acetonitrile δ 1.94), carbon (chloroform δ 77.0, acetonitrile δ 118.26, 1.39), and chemical shifts are reported in ppm. GC-MS data was recorded on an ISQ LT Single Quadrupole Mass Spectrometer, coupled with a Trace 1300 Gas Chromatograph (Thermo Fisher Scientific). Melting points were measured on a melting point apparatus and were uncorrected. High resolution mass spectral data were acquired on Waters Micromass GCT Premier spectrometer (electrospray ionization: EI).

\begin{align*}
\text{CF}_3\text{SO}_2\text{Na} & \rightarrow \text{CF}_3\text{N} \quad \text{1a) PPh}_3, \text{MeCN, r.t.} \\
& \quad \text{2) AgF, 50 °C}
\end{align*}
\]

In a nitrogen-filled glovebox, a 10 mL oven-dried reaction vessel was charged with CF$_3$SO$_2$Na (0.75 mmol, 117 mg, 1.5 equiv.) and PPh$_3$ (1.5 mmol, 393 mg, 3 equiv.), N-Methylaniline (0.5 mmol, 54 mg, 1.0 equiv.) was dissolved in MeCN (2.5 mL) and the solution was added to the vessel. The resulting solution was stirred at room temperature for 1h. After that, AgF (2.25 mmol, 286 mg, 4.5 equiv) was added. The resulting mixture was further stirred at 50 °C for 5 h. After cooling to room temperature the volatiles were removed under vacuum and the residue was purified by column chromatography to give the corresponding products.

The following reactions do not require glove box.
To a mixture of CF$_3$SO$_2$Na (0.5 mmol, 78 mg.) and PPh$_3$ (1 mmol, 262 mg.) was added MeCN (2 mL), the resulting solution was stirred at room temperature for few minutes, then the mixture was used for MS-EI test. The result was shown in the following spectra.

To a mixture of C$_6$F$_{13}$SO$_2$Na (0.5 mmol, 203 mg.) and PPh$_3$ (0.5 mmol, 131 mg.), Ph$_2$PCl (0.5 mmol, 110 mg.) dissolved in MeCN (3 mL) was added, the resulting solution was stirred at room temperature for few minutes, then the mixture was used for MS-EI test. The result was shown in the following spectra.
