1. General

The melting points were determined on SRS-Optimelt Automated Melting Point System, and were uncorrected. All the dipolarophiles and solvents were commercially available and used as received. The $^1$H NMR spectra were measured on a Bruker Ascend-400 at 400 MHz with tetramethylsilane as an internal standard. The $^{13}$C NMR spectra were measured on a Bruker Ascend-400 at 100 MHz, and assignments of $^{13}$C NMR spectra were performed by DEPT experiments. The high-resolution mass spectra were measured on an AB SCIEX Triple TOF 4600. The IR spectra were recorded on a JASCO FT/IR-4200 spectrometer.

2. Experimental procedure and spectral data

**Synthesis of pyridinium salt 6**

Pyridinium salt 6 was synthesized by 2 steps reactions from commercially available ethyl nitroacetate via methyl 3-methoxy-2-nitropropenoate.

![Chemical reaction diagram]

To a solution of methyl 3-methoxy-2-nitropropenoate (16.1 g, 100 mmol) in ethanol (160 mL), were added NH$_2$OH•HCl (7.73 g, 120 mmol) and pyridine (20.2 mL, 250 mmol). The resultant mixture was heated at 60 °C for 3 h. After cooling, precipitated pale yellow needles were collected by filtration to afford pyridinium salt 6 (14.8 g, 71 mmol, 71%).
Synthesis of dipotassium salt 5b

Pyridinium salt 6 (2.09 g, 10 mmol) was dissolved in 0.5 M MeOH solution of KOH (40 mL, 20 mmol), and stirred at room temperature for 15 min. A pale-yellow precipitate was observed during the stirring. The solid was collected by filtration to afford dipotassium cyano-aci-nitroacetate 5b (2.01 g, 9.76 mmol, 98%).

 Typical procedure for synthesis of 3-cyanoisoxazoles 8 and 11

In a screw capped test tube, dipotassium salt 5b (41.2 mg, 0.2 mmol) was dissolved into a mixed solvent of MeCN/H2O (v/v = 1/1, 2 mL). After adding ethynylbenzene 7a (110 µL, 1 mmol) and 1 M HCl (3 mL, 3 mmol), the resultant mixture was heated at 100 °C for 12 h in a sealed tube. The solvent was removed under reduced pressure, and MeCN (10 mL) was added to the residue. After filtration to remove the insoluble material, the filtrate was concentrated to afford 3-cyano-5-phenylisoxazole 8a (163 mg, 0.96 mmol, 96%) as a brown solid. Mp 84–88 °C. 1H NMR (400 MHz, DMSO-d6) δ 7.60–7.63 (m, 3H), 7.79 (s, 1H), 7.92–7.97 (m, 2H); 13C NMR (100 MHz, DMSO-d6) δ 103.2 (C), 110.4 (C), 125.1 (C), 126.0 (CH), 129.5 (CH), 131.7 (CH), 140.1 (C), 172.0 (C); IR (ATR / cm⁻¹) 2253.

When other dipolarophiles were used, the experiments were conducted in a same way.

3. Monitoring of the structural changes by $^1$H NMR (in CD$_3$CN)

a) From pyridinium salt of nitroisoxazolone 6 to cyano-aci-nitroacetate 5a

When 1 equiv. $N$-methylpyrrolidine was added to a solution of pyridinium salt 6, signals of the pyridine ring shifted to the higher field, and signals of pyrrolidine shifted to the lower field. This change indicates that the counter cation of 6 exchanged from pyridinium ion to pyrrolidinium ion to afford 6’. The singlet signal at 8.3 ppm disappeared when further 1 equiv. $N$-methylpyrrolidine was added. This spectral change means that deprotonation of the isoxazolone ring occurred at the 3-position, which causes the ring opening reaction to furnish cyano-aci-nitroacetate 5a.
b) Acidification of cyano-aci-nitroacetate 5a

When 3 equiv. HCl were added to a solution of cyano-aci-nitroacetate 5a in CD₃CN, a new singlet signal was observed at 5.8 ppm which was assigned to nitroacetonitrile 4.
c) Cycloaddition of nitroacetonitrile 4 with ethynylbenzene 7a.

To a solution of nitroacetonitrile 4 in CD$_3$CN, ethynylbenzene 7a was added, and the resultant solution was heated at 100 °C for 1 d. While the signal of 4 disappeared, signals of 3-cyanoisoxazole 8a were newly observed. In addition, signals of ammonium chloride was also observed, which is presumably formed by acid hydrolysis of acetonitrile.
Nitroacetonitrile 4 rapidly decomposed in air at 109 °C, releasing 874 J/g of energy. This classifies it as an explosive material according to UN Orange Book.\textsuperscript{5} Conversely, cyano-\textit{aci}-nitroacetate 5a and pyridinium salt 6 were stable even at 140 °C, and smaller energies (250 and 163 J/g, respectively) were released, indicating that both compounds are safely handleable reagents under air.
