EXPERIMENTAL SECTION

General Considerations. Unless otherwise stated, all reactions were performed under an argon atmosphere with anhydrous solvents using Schlenk technics. THF and Et₂O were distilled over sodium/benzophenone. Unless otherwise stated, all reagents were used without prior purification. 2,2,6,6-Tetramethylpiperidine (TMPH) was distilled under vacuum over CaH₂ and was stored over KOH pellets. All organolithiated reagents were titrated before use.¹ Column chromatography separations were achieved on silica gel (40-63 μm). All Thin Layer Chromatographies (TLC) were performed on aluminum backed plates pre-coated with silica gel (Merck, Silica Gel 60 F254). They were visualized by exposure to UV light. Melting points were measured on a Kofler bench. IR spectra were taken on a Perkin-Elmer Spectrum 100 spectrometer. ¹H, ¹³C and ¹⁹F Nuclear Magnetic Resonance (NMR) spectra were recorded either (i) on a Bruker Avance III spectrometer at 300 MHz and 75.4 MHz, respectively, or (ii) Bruker Avance III HD at 400 MHz and 100 MHz, respectively. ¹H chemical shifts (δ) are given in ppm relative to the solvent residual peak and ¹³C chemical shifts are relative to the central peak of the solvent signal. Cp refers to the unsubstituted cyclopentadienyl ring of ferrocene. Optical rotations were recorded at 20 °C on a Perkin Elmer 341 polarimeter. Enantiomeric ratios (er) were determined by chiral HPLC on a ThermoFisher Ultimate 3000 apparatus. Racemic Ugi’s amine ((±)-7) was prepared according to Šebesta and Ugi.² 2-Fluoro-1-iodo-3-(trimethylsilyl)ferrocene ((±)-1) was prepared according to Erb.³

Safety Considerations. Due to their pyrophoric character, BuLi reagents need to be used only under inert conditions (anhydrous, nitrogen or argon atmosphere) and by people well-trained to the manipulation of reactive organometallics. Due to the inherent dangers of using cryogenic temperatures, experiments should be performed by well-trained people.

Crystallography. For (±)-8, (±)-10, (±)-13, (R,S)p-13, (±)-14, (R,S)p-14, the X-ray diffraction data were collected using D8 VENTURE Bruker AXS diffractometer at the temperature given in the crystal data. The samples were studied with monochromatized Mo-Kα radiation (λ = 0.71073 Å). The structure was solved by dual-space algorithm using the SHELXT program,⁴ and then refined with full-matrix least-square methods based on F² (SHELXL).⁵ All non-hydrogen atoms were refined with anisotropic atomic displacement parameters. H atoms were finally included in their calculated positions and treated as riding on their parent atom with constrained thermal parameters. The molecular diagrams were generated by MERCURY (version 3.9).

(±)-2-(Dimethylaminomethyl)-3-fluoro-1-iodo-4-(trimethylsilyl)ferrocene (±)-2

nBuLi (1.4 M in hexane, 4.70 mL, 6.60 mmol, 1.10 equiv) was added dropwise to a solution of TMPH (1.12 mL, 932 mg, 6.60 mmol, 1.10 equiv) in THF (12.0 mL) at -15 °C. After addition, the reaction was stirred for 5 min at the same temperature before being cooled to -50 °C. After 5 min, compound (±)-1 was added in one portion and the reaction mixture was stirred at -50 °C for 90 min. Eschenmoser’s salt (1.22 g, 6.60 mmol, 1.10 equiv) was added in one portion and the reaction mixture was slowly warmed to rt. Aqueous K2CO3 solution (sat., 10 mL) was added and the reaction mixture was extracted with EtOAc (3 x 20 mL). The combined organic layers were dried over MgSO4, filtrated over cotton wool and concentrated under vacuum using a rotary evaporator to give the crude product. This was purified by column chromatography over SiO2, using PET-EtOAc (70:30) with 1% of NEt3 to give the title product as an orange oil (2.31 g, 84%).

The resulting solids were washed with Et₂O (2 x 2 mL) and dried under high vacuum to give the title product as an orange solid (45.4 mg, quant.).

(R,Sp)-1-Chloro-2-fluoro-4-iodo-5-(α,N,N,N-tetramethylaminomethyl)-3-(trimethylsilyl)ferrocene iodide ((R,Sp)-17)

By following a similar protocol, starting from (R,Sp)-14 (35.5 mg, 0.07 mmol, 1.00 equiv), the title product was obtained as an orange solid (45.3 mg, quant.). Analytical data analogous to racemic compound. [α]D +0.643 (c 0.01 in CH3CN).
