1. General

Unless otherwise noted, all the reactions were carried out under an Argon atmosphere using standard Schlenk techniques. Glassware was dried in an oven (150 °C) and heated under reduced pressure prior to use. Solvents were employed as eluents for all other routine operation, as well as dehydrated solvents were purchased from commercial suppliers and employed without any further purification. For thin layer chromatography (TLC) analyses throughout this work, Merck precoated TLC plates (silica gel 60 GF254, 0.25 mm) were used. Silica gel column chromatography was carried out using silica gel 60 N (spherical, neutral, 40-100 μm) from Kanto Chemicals Co., Ltd. NMR spectra (1H, 13C{1H} and 19F{1H}) were recorded on Varian INOVA-600 (600 MHz) or Mercury-400 (400 MHz) spectrometers. Chemical shifts (δ) are in parts per million related to CDCl₃ at 7.26 ppm for 1H and at 77.16 ppm for 13C{1H}. The 19F{1H} NMR spectra were measured by using CCl₃F (δ = 0.00 ppm) as an external standard. The GC yields were determined by GC analysis of the crude mixture, using n-dodecane as an internal standard. GC analyses were performed on a Shimadzu GC-14A equipped with a flame ionization detector using Shimadzu Capillary Column (CBP1-M25-025) and Shimadzu C-R6A-Chromatopac integrator. Infrared spectra were recorded on a SHIMADZU IRP restige-21 spectrophotometer. HRMS analyses were obtained by using a double focusing magnetic sector mass spectrometer (JEOL JMS-700 MStation). Elemental analyses were carried out with a Perkin-Elmer 2400 CHN elemental analyzer at Okayama University.

Chemicals

Unless otherwise noted, materials obtained from commercial suppliers were used without further purification. Bis(1,5-cyclooctadiene)nickel was purchased from Merck. Triphenylphosphine and potassium fluoride (purity > 95%) were obtained from Nacalai Tesque. n-Dodecane (purity > 99%) was purchased from Kanto Chemical Co. Acyl fluorides 1a-1v and silylboranes 2a-2e were prepared according to the literatures and showed the identical spectra reported.

Scheme S2. One-Pot Reaction from Probenecid without Isolating Aroyl Fluoride 1u

To a 20 mL of Schlenk tube charged with a magnetic stirrer bar, were successively added probenecid (0.2 mmol, 57.1 mg), TFFH (0.2 mmol, 1 equiv, 52.8 mg), proton sponge (0.2 mmol, 1 equiv, 42.9 mg) and THF (0.4 mL). After the reaction mixture was stirred at room temperature for 30 min, a pre-mixed solution of Ni(cod)_2 (0.02 mmol, 10 mol %, 5.5 mg), PPh_3 (0.08 mmol, 40 mol %, 21.0 mg) in toluene (1 mL) was added. Successively, KF (0.6 mmol, 3 equiv, 36.6 mg), Et_3Si-Bpin (2a) (0.4 mmol, 2 equiv, 96.9 mg) and CuF_2 (0.06 mmol, 30 mol %, 6.1 mg) were added. The mixture was heated at 150 °C with stirring. After 24 h, \text{n-dodecane} was added as an internal standard and the mixture was stirred vigorously. Take a portion of the mixture, diluted by Et_2O (2 mL), GC analysis was conducted using resulting organic phase, which indicated the formation of 3u in 28% yield.
3. Synthesis and Characterization of Starting Materials

3.1 Representative Procedure for the Synthesis of Acyl Fluorides from Acyl Chlorides

To a 50 mL of Schlenk tube charged with a magnetic stirrer bar, were successively added acyl chloride 1-Cl (4.0 mmol), 18-crown-6 (0.2 mmol, 5 mol %, 52.9 mg), KF (40 mmol, 10 equiv, 2.32 g) and THF (20 mL). After the reaction was stirred at 40 ºC for 24 h, the insoluble inorganic solid (KF or KCl) was filtered, and the volatiles were concentrated using a rotary evaporator. The crude product was purified by bulb-to-bulb distillation to afford the corresponding acyl fluorides 1.

3.2 Representative Procedure for the Synthesis of Acyl Fluorides from Carboxylic Acids

To a 20 mL of Schlenk tube charged with a magnetic stirrer bar, were successively added carboxylic acid 1-OH (3.0 mmol) and CH2Cl2 (15 mL). After the mixture was stirred at 0 ºC, Deoxo-Fluor® reagent (3.3 mmol, 1.1 equiv, 608 μL) was slowly added to the reaction mixture. After the reaction mixture was stirred at 0 ºC for 30 min, the solution was slowly poured into saturated NaHCO3, and after CO2 evolution ceased it was extracted into CH2Cl2 (3 × 15 mL), and dried over MgSO4. The crude product was purified by flash chromatography to afford the corresponding acyl fluorides 1.

Metallic lithium (120 mmol, 826 mg) was added to THF (30 mL) under an argon flow. The flask was placed in an ice bath and dimethylphenyl(chloro)silane (30 mmol, 5 mL) was added dropwise. The mixture was stirred at room temperature overnight, and the volatile materials were removed under reduced pressure. The residue was extracted with n-hexane (30 mL) and filtered through Celite under argon (Celite was dried under reduced pressure before use). The solvent was removed under reduced pressure and the product was purified by bulb-to-bulb distillation (bp = 120 °C at 0.1 mbar).
4. Decarbonylative Silylation of Acyl Fluorides

4.1 Representative Procedure for Decarbonylative Silylation of Acyl Fluorides 1 with Silylborane 2a

A 20 mL dried Schlenk tube containing a stirrer bar and KF (0.6 mmol, 3 equiv, 36.6 mg) was dried with a heat gun under reduced pressure and filled with argon after cooling to room temperature. To this vessel, were added Ni(cod)₂ (0.02 mmol, 10 mol %, 5.5 mg), PPh₃ (0.08 mmol, 40 mol %, 21.0 mg), toluene (1 mL), acyl fluoride (1, 0.2 mmol), triethyl(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)silane (2a, 0.4 mmol, 2 equiv, 96.9 mg), and CuF₂ (0.06 mmol, 30 mol %, 6.1 mg). The mixture was heated at 150 °C with stirring for 24 h. The solution was then cooled to room temperature, and the solvent was removed under vacuum. The decarbonylative silylation product 3 was purified by flash column chromatography on silica gel.

The precipitate was filtered, washed with water, dried under vacuum to give a white solid (388.3 mg, 96%).\(^9\) \(^1\)H NMR (600 MHz, (CD\(_3\))\(_2\)SO): δ 0.81 (s, 3H), 1.30-1.39 (m, 3H), 1.44-1.57 (m, 3H), 1.72-1.77 (m, 1H), 1.89-1.96 (m, 2H), 2.05 (dt, \(J = 18.5, 8.5\) Hz, 1H), 2.14-2.18 (m, 1H), 2.29-3.35 (m, 1H), 2.43 (dd, \(J = 18.5, 8.5\) Hz, 1H), 2.79-2.82 (m, 2H), 3.36 (brs, 1H), 5.14 (s, 2H), 6.72 (d, \(J = 2.8\) Hz, 1H), 6.76 (dd, \(J = 8.6, 2.8\) Hz, 1H), 7.17 (d, \(J = 8.6\) Hz, 1H), 7.52 (d, \(J = 8.0\) Hz, 2H), 7.95 (d, \(J = 8.0\) Hz, 2H); \(^13\)C\(^{1}\)H NMR (151 MHz, (CD\(_3\))\(_2\)SO): δ 13.6, 21.2, 25.5, 26.1, 29.2, 31.4, 35.4, 37.8, 43.5, 47.4, 49.6, 68.4, 112.3, 114.6, 126.4, 127.2, 129.5, 130.3, 132.2, 137.6, 142.4, 156.0, 167.2, 219.8.
