‡Both authors contributed equally to this work.
1. Physical Measurements and Instrumentation.

Materials and Methods. All required chemicals were obtained from commercial sources and solvents were dried properly whenever it was necessary. FT-IR spectra of the compounds were recorded in Perkin Elmer Spectrum BX FT-IR system. Mass spectra were measured on a MicroMass ESI-TOF spectrometer. $^1$H-NMR (400 MHz) and $^{13}$C-NMR (100 MHz) spectra were recorded in Bruker-400 Avance NMR spectrometer. Elemental analysis was performed on a Carlo Erba elemental analyzer model 1106.

Gelation Studies. A certain amount of 1 had been added into a properly capped glass vial containing appropriate solvent with heating and sonication to get a clear solution. After that, the solution was cooled and left for 0.5 h. The gelation test was performed using the inverse flow method. Upon gelation, the gel was further characterized quantitatively by determining the critical gelator concentration (CGC). CGC is defined as the minimum amount of compound required to form gel in 1 mL of solvent. For compound 2, 1 and PdCl$_2$(PhCN)$_2$ (2:1 molar ratio) were mixed in DCM/CHCl$_3$ and kept at room temperature to form gel.

Differential Scanning Calorimetry (DSC). Differential Scanning Calorimeter (DSC; Perkin-Elmer, Model Pyris 1D) was used to record thermotropic phase transition behavior of 1 in solid phase. During the experiments, the heating and cooling rates were fixed at 2 °C min$^{-1}$.

UV-Vis Spectroscopy. UV-Vis spectra 1 and 2 in solution were recorded on Shimadzu model 2600 spectrophotometer.

Inverted Phase-contrast Optical Microscopy: Gel of compound 1 in ethanol was taken in a properly cleaned glass slide and covered with a coverslip. The images were recorded in phase contrast mode (Olympus CX 81).

Scanning Electron Microscopy (SEM). The gel samples (1 and 2) were drop-coated onto a cover-slip which was glued on brass stubs. Then samples were kept for drying. Before experiments, samples were coated with platinum vapor. JEOL JSM-7500F (Field Emission Scanning Electron Microscope) operated at 1-10 kV was used to record images for this experiment.

Atomic Force Microscopy (AFM). A diluted solution of the gelator (2) has been drop-coated on freshly cleaved mica and then dried in open air. The microscopic measurements were performed in tapping mode (JPK instruments, NanoWizard JPK00901 software).

Transmission Electron Microscopy (TEM). The aggregates of the gelators (2) were examined under a transmission electron microscope. A solution of 2 (10 µl) sample was drop coated onto a 400 mesh copper grids and allowed to dry. Then, the sample was observed under TEM (JEOL2100F) with an acceleration voltage of 200 kV.

Polarized Optical Microscopy (POM). Birefringence at different temperatures of the sample (1) had been followed under polarized optical microscope (Olympus BX 51) which was equipped with a heating stage (Mettler FP82HT) and a central processor (Mettler FP90).

Powder X-ray Diffraction (PXRD). Both gels (1 and 2) were scooped onto a properly cleaned glass slide. After that samples were freeze-dried under vacuum before PXRD measurements. XRD measurements were performed in a Bruker D8 Advance instrument. X-ray beam for this experiment was generated by rotating Cu anode at the wavelength of 1.5418 Å and the sample was scanned from 1 to 30° (2θ). Variable temperature XRD experiments of 1 (solid) were performed in a properly sealed capillary.

Rotating-frame Overhauser Spectroscopy (ROESY).

The ROESY experiment was performed in 700 MHz Bruker-Avance instrument with a mixing time of 250 ms and ROESYPH pulse sequence at 293 K. During this measurement, a ROESY continuous-wave spin-lock of 1.5 KHz was applied to collect 2k points and 512 points in the f2 and f1 domain respectively. Bruker TOPSPIN 2.1 software was used for processing data.
2. Synthesis and Characterization:
Synthesis of 3,4,5-tris(2-(2-(2-methoxyethoxy)ethoxy)ethoxy)benzohydrazide (5) was carried out based on reported procedures\textsuperscript{S1}. Synthetic scheme of compound (1) and palladium-complex (2) is shown below.

\textsuperscript{a}Reagents, conditions and yields: (i) Tosyl Chloride, NaOH-THF-H\textsubscript{2}O, 0 °C-rt, 6h, 90%; (ii) Ethyl gallate, \textit{K}_\text{2}CO\textsubscript{3}, CH\textsubscript{3}CN, reflux, 12h, 75%; (iii) Hydrazine hydrate, methanol, reflux, 12h, 95%; (iv) Dry DMF, 140 °C, 12h, 20%. (v) \textit{PdCl\textsubscript{2}}(PhCN)\textsubscript{2}, dry DCM, rt, 1h, quantitative.

Synthesis of Compound 1:

1,4,5,8-naphthalene tetracarboxylic dianhydride (1.3 g, 4.84 mmol), 4-picolyamine (0.52 g, 4.8 mmol) and 3,4,5-tris(2-(2-(2-methoxyethoxy)ethoxy)ethoxy)benzohydrazide\textsuperscript{S1} (3 g, 4.82 mmol) were mixed together and dry
DMF was added to it. The solution was refluxed for 12h in N<sub>2</sub> atmosphere at 140 °C. After that, the organic solvent was removed in vacuum with heating. The compound was purified by column chromatography using chloroform and methanol (v/v 100:2) as solvent. The purified yield was 0.93 g, 20%.

FT-IR (Neat, cm<sup>-1</sup>): 2873, 1696, 1664, 1582, 1492, 1421, 1329, 1243, 1204, 1102, 991, 848, 794, 759; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, ppm): δ 3.26 (s, 6H), 3.38 (s, 3H), 3.5 (t, 4H, 4 Hz), 3.55 (t, 2H, 4 Hz), 3.62-3.73 (m, 18H), 3.80-3.85 (m, 6H), 4.27-4.28 (m, 6H), 5.40 (s, 2H), 7.4 (d, 2H, 5.2 Hz), 7.45 (s, 2H), 8.58 (d, 2H, 5.2 Hz), 8.82 (s, 4H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>, ppm): δ 43.1, 58.9, 59.0, 69.1, 69.7, 69.7, 70.2, 70.43, 70.45, 70.51, 70.54, 70.59, 71.84, 71.90, 72.31, 108.3, 123.4, 126.3, 126.5, 126.8, 126.9, 127.0, 131.41, 131.53, 142.05, 145.5, 149.89, 152.33, 160.85, 162.7, 165.6; ESI-MS (HRMS): Calcd. for [C<sub>48</sub>H<sub>58</sub>N<sub>4</sub>O<sub>17</sub> + Na]<sup>+</sup> 985.3695; Found 985.3695; Anal. Calcd for C<sub>48</sub>H<sub>58</sub>N<sub>4</sub>O<sub>17</sub>.H<sub>2</sub>O: C 58.77, H 6.17, N 5.71. Found: C 58.72, H 6.19, N 5.68.

**Synthesis of palladium complex (2):**

In a mixture of compound 1 (200 mg, 0.207 mmol) and palladium Bis(benzonitrile)palladium(II) chloride (39 mg, 0.103 mmol) was dissolved in dry DCM. The homogenous mixture was stirred for one hour. After that DCM was evaporated in vacuum to get the pure metal complex without any column chromatographic separation.

FT-IR (Neat, cm<sup>-1</sup>): 2873, 1670, 1619, 1580, 1522, 1489, 1425, 1329, 1244, 1190, 110, 1022, 995, 936, 851, 760; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, ppm): δ 3.24 (s, 12H), 3.38 (s, 6H), 3.48 (m, 8H), 3.55 (m, 4H), 3.61-3.72 (m, 36H), 3.83 (m, 12H), 4.72 (m, 12H), 5.38 (s, 4H), 7.45 (s, 4H), 7.47-7.48 (d, 4H, 6 Hz), 8.74-8.75 (d, 4H, 6.4 Hz), 8.78-8.84 (m, 8H), 9.6 (s, 2H); Anal. Calcd for C<sub>96</sub>H<sub>116</sub>Cl<sub>2</sub>N<sub>8</sub>O<sub>34</sub>Pd: C 54.82, H 5.56, N 5.33. Found: C 54.87, H 5.60, N 5.29.
