The starting materials were obtained from commercial suppliers and used as received unless otherwise noted. Solvents were also purchased from commercial suppliers, and dried over molecular sieves (MS 4Å). Mechanochemical reaction was carried out using grinding vessels in a Retsch MM400 mill (Supplementary Figure 1). Both jar (25 mL) and ball (diameter: 10 mm) are made of stainless (Supplementary Figure 1). NMR spectra were recorded on JEOL JNM-ECX400P and JNM-ECS400 spectrometers (1H: 392, 396, 400 or 401 MHz, 13C: 99, 100 or 101 MHz, 31P: 160 MHz). Tetramethylsilane (1H), CDCl3 (1H, 13C) and H3PO4 (31P) were employed as external standards, respectively. Multiplicity was recorded as follows: s = singlet, br, s = broad singlet, d = doublet, t = triplet, quint = quintet, sext = sextet, sep = septet, m = multiplet. Dibromomethane or 1,2-diphenylethane were used as an internal standard to determine NMR yields. GLC analyses were conducted with a Shimadzu GC-2014 or GC-2025 equipped with ULBON HR-1 glass capillary column (Shinwa Chemical Industries) and a FID detector. High-resolution mass spectra were recorded at the Global Facility Center, Hokkaido University. Melting points were measured using an ATM-02, AS ONE melting point apparatus. Single crystal X-ray structural analyses were carried out on a Rigaku XtaLAB PRO MM007 diffractometer using graphite monochromated Mo-Kα radiation. The structure was solved by direct methods and expanded using Frontier techniques. Non-hydrogen atoms were refined anisotropically. Hydrogen atoms were refined using the riding model. All calculations were performed using Olex crystallographic software package except for refinement, which was performed using SHELXL.1

(COD)Pd(CH₂TMS)₂ 1 was prepared by according to the reported procedure.² The material 1 is thermo-sensitive and must be stored at a temperature of −20 °C or lower to avoid decomposition, while the material can be stored out of glovebox and used in air.

1 (38.9 mg, 0.10 mmol) and Xantphos (2) (57.9 mg, 0.10 mmol, 1.0 equiv) were placed in an oven-dried reaction vial, then MeCN (1.0 mL) was added. The reaction mixture was stirred at room temperature for 20 minutes, then the solvent was removed under reduced pressure. The crude product was washed with pentane and Et₂O and dried under reduced pressure to afford the palladium complex 3 as a yellow solid (66.5 mg, 0.0773 mmol, 78% yield).

³¹P NMR (160 MHz, CDCl₃, δ): 8.9. HRMS-ESI (m/z): [M–TMSCH₂]⁺ calcd for C₄₃H₄₃OP₂PdSi, 771.1593; found, 771.1587.

Gram-scale synthesis of palladium complex 3 by mechanochemistry

1 (3.0 mmol) and 2 (3.0 mmol, 1.0 equiv) were placed in a ball milling vessel (stainless, 25 mL) loaded with two grinding balls (stainless, diameter: 10 mm), then THF (0.58 mL, 0.20 µL mg⁻¹) was added via syringe. After the vessel was closed in air without the purge with inert gas, the vessel was placed in the ball mill (Retch MM400, 5 min at 25Hz). The crude product was washed with pentane and Et₂O and dried under reduced pressure to afford the corresponding palladium complex 3 as a yellow solid (2.50 g, 2.9 mmol, 97% yield).
