1. General considerations

Unless otherwise noted, all reagents were purchased from commercial suppliers and used without purification. All cascade reactions were performed in a resealable screw-capped Schlenk flask (approximately 20 mL volume) in the presence of Teflon-coated magnetic stirrer bar (4.5 mm × 12 mm). 1,4-Dioxane was distilled from sodium benzophenone ketyl under nitrogen. ¹ Toluene and nitromethane were distilled from calcium hydride under nitrogen. Thin layer chromatography was performed on Merck precoated silica gel 60 F₂₅₄ plates. Silica gel (Merck, 230-400 mesh) was used for column chromatography. Melting points were measured on an uncorrected Büchi Melting Point B-545 instrument. ¹H NMR spectra were recorded on a Bruker (400 or 500 MHz) spectrometer. Spectra were referenced internally to the residual proton resonance in CDCl₃ (δ 7.26 ppm), or DMSO (δ 2.50 ppm) or CD₃OD (δ 4.89 ppm), or with tetramethylsilane (TMS, δ 0.00 ppm) as the internal standard. Chemical shifts (δ) were reported as part per million (ppm) in δ scale downfield from TMS. ¹³C NMR spectra was recorded on a Bruker (100 or 125 MHz) spectrometer. Spectra were referenced internally to the residual proton resonance in CDCl₃ (δ 77.0 ppm, the middle peak). Coupling constants (J) were reported in Hertz (Hz). Mass spectra (EI-MS and ES-MS) were recorded on a HP 5989B Mass Spectrometer. High-resolution mass spectra (HRMS) were obtained on Bruker SolariX 9.4T FTMS mass spectrometer (APCI-DIP). Compounds described in the literatures were characterized by comparison of their ¹H, and/or ¹³C NMR spectra to the previously reported data.

2. General procedure for the synthesis of propargylamines

To a 25 mL round-bottom flask equipped with a magnetic stir bar were added amine (6.5 mmol), aldehyde (5.0 mmol), acetylene (6.5 mmol), copper (I) iodide (20 mol%) and toluene (10 mL). The mixture was degassed and backfilled with nitrogen, and then stirred in an oil bath preheated to 80 °C for 8 h (monitored by TLC). After the reaction completed (as determined using TLC), the reaction mixture was cooled to room temperature, diluted with CH₂Cl₂ (10 mL) and filtered through a thin pad of silica gel. The filter cake was washed with CH₂Cl₂, and the combined filtrate was concentrated in vacuum. The crude product was purified by flash column chromatography on silica gel to afford the corresponding propargylamines 1a-1z, 1a'-1c', 4.

A mixture of propargylamines 1 (0.4 mmol), β-naphthol 2 (0.48 mmol), and ZnI₂ (0.04 mmol) were added to a resealable screw-capped Schlenk tube. Then nitromethane (4 mL) was added. The tube sealed with a Teflon-coated cap and the resulting mixture was stirred in an oil bath preheated to 110 °C for 24 h (monitored by TLC). Upon completion of the reaction, the reaction mixture was cooled to room temperature, and the solvent was removed under reduced pressure. The residue was purified using flash column chromatography with a silica gel (230-400 mesh), using n-hexane and dichloromethane (1:1-4:1, v/v) as the elution solvent to afford the desired product 3.
