General Information:

THF was freshly distilled from benzophenone ketyl radical under nitrogen prior to use, while Hünig's base (diisopropylethylamine) was distilled from calcium hydride. Most anhydrous solvents (dichloromethane and diethyl ether) were obtained by passing through activated alumina columns on a solvent purification system. All the chemicals were purchased from Sigma Aldrich and used as received from the supplier without further purification unless mentioned otherwise. All ketenes were synthesized according to reported literature procedures.

NMR spectra were recorded on a Bruker DPX Avance 200 spectrometer (200 MHz for $^1$H and 50 MHz for $^{13}$C) and on a Bruker Biospin AG 400 spectrometer (400 MHz for $^1$H and 100 MHz for $^{13}$C). NMR chemical shifts were reported relative to TMS (0 ppm) for $^1$H and to CDCl$_3$ (77.23 ppm) for $^{13}$C spectra. High resolution mass spectra were recorded on Agilent Technologies 6520 Accurate Mass Q-TOF LC-MS instrument at Oakland University. Low resolution mass spectra were recorded on a GC/MS Hewlett Packard HP 6890 GC instrument with a 5973 mass selective detector. IR spectra were recorded on a Bio Rad FTS-175C spectrometer. Optical rotations were measured on a Rudolph DigiPol 781 TDV automatic polarimeter.

Chiral high-performance liquid chromatography analysis (HPLC) was performed using Daicel Chiralpak AD, Chiralpak AD-H, Chiralpak AS, Chiralpak AS-H, Chiralpak OD and Chiralpak OD-H (25 × 0.46 cm) (Daicel chemical Ind., Ltd.) on a Perkin Elmer Flexar instrument attached with diode array detector (deuterium lamp, 190-600 nm) with HPLC-grade isopropanol and hexanes as the eluting solvents. Enantiomeric excesses were determined at $\lambda$ = 254 or 225 nm (details given for each compound).

Donor-Acceptor Cyclopropanes:

Cyclopropanes 1a-1e were prepared according to procedures known in the literature.

General procedure for cyclopentanone synthesis:
To a stirring suspension of indium bromide (0.09 mmol) in dichloromethane (3.0 mL) at −25 °C, a solution of cyclopropane (0.3 mmol) in dichloromethane (2.0 mL) and ethylaluminium dichloride solution (1.0 M in hexanes, 0.045 mmol) were added. To this stirring reaction mixture, a solution of ketene (0.39 mmol) in dichloromethane (1.0 mL) was added over a period of 4 h via syringe pump. The reaction was stirred at this temperature for another 4 h and then quenched by addition of a mixture of methanol-triethylamine (2:1, 1.0 mL). Then the reaction mixture was poured into cold 10% hydrochloric acid solution (20 mL) and extracted with dichloromethane (25 mL × 2). The combined organic layers were washed with water (30 mL), brine (30 mL), and dried over sodium sulfate. Diastereomeric ratio was determined by GC-MS analysis of the crude product after workup. Removal of the solvent under reduced pressure followed by regular silica gel column chromatographic purification using a mixture of ethyl acetate and hexanes (details mentioned below) afforded pure desired product.

Cyclopentanone 4t was also exposed to the same conditions and 5t was obtained with dr = 1.7:1.

**Determination of absolute and relative stereochemistry of cyclopentanones 4:** The absolute stereochemistry of the major isomer of all cyclopentanones was deduced from X-ray crystal structure analysis of two crystalline minor isomers 4u and 4w, and comparing the chemical shift value of 3-Me group in major and minor isomer. Minor isomer 4u was determined to have (3S,4R) absolute configuration and trans (anti)-relative stereochemistry. Major isomer 4t, and all other major isomers by analogy, were deduced to possess (3R,4R) absolute stereochemistry and cis (syn)-relative stereochemistry. The assignment of cis (syn)-relative stereochemistry for the major isomer of cyclopentanones was further confirmed by NOESY experiments. Analogous results were obtained for 4v and 4w.

Experimental

The data were collected at 100(1) K on a Synergy, Dualflex, AtlasS2 diffractometer using CuKα radiation (λ = 1.54184 Å) and the CrysAlis PRO 1.171.40.29a suite. Using SHELXL and Olex2 the structure was solved by dual space methods (SHELXT) and refined on F² using all the reflections (SHELXL-2018/3). All the non-hydrogen atoms were refined using anisotropic atomic displacement parameters. Hydrogen atoms were inserted at calculated positions using a riding model. Absolute configurations were unambiguously determined for the enantiomeric pair 4w and 4u. Crystal data, data collection and structure refinement details are summarised in Table S1.

4w and 4u C₂₃H₂₄O₅

Fig S5. 50% ellipsoid plots for 4w (left) and 4u (right).

4w and 4u constitute an enantiomeric pair, both refined in P2₁2₁2₁ and are chiral at C8 and C15.

There are no very striking intermolecular interactions in the structure.
