General remarks for experimental

$^1$H NMR, $^{13}$C NMR spectra were measured on a Bruker Avance 400 MHz spectrometer and a 600 MHz NMR spectrometer (JEOL ECZ600R/S3) equipped with a 14.09 T superconducting magnet and a 5.0 mm 600MHz broadband Z-gradient high resolution ROYAL probe (JEOL RESONANCE Inc., Japan). Proton Chemical shifts of NMR spectra were given in ppm relative to internals reference TMS (1H, 0.00 ppm). Mass spectra were measured on a HP-1100 LC-MS spectrometer. UV-vis spectra were recorded on UV-3900 spectrometer. Fluorescence spectra were recorded on FLS 1000 fluorimeter. Confocal microscopy fluorescence images were acquired on Leica TCS SP8. The solvents used for UV-vis and fluorescence measurements were of HPLC grade. Unless otherwise noted, materials were obtained from commercial suppliers and were used without further purification. All the solvents were dried according to the standard methods prior to use. All of the solvents were either HPLC or spectroscopic grade in the optical spectroscopic studies.

Fluorescence analysis.

Stock solution of the probe (5 mM) was prepared in HPLC grade DMSO. Stock solutions of analytes were prepared in twice-distilled water. For spectral measurements, the probe was diluted to 10 µM with 10 mM PBS solution containing 1 mM Triton X-100. 3.0 mL probe solution was placed in a quartz cell of 1 cm optical path length each time. All spectroscopic experiments were carried out at room temperature.

Cell culture

MCF-7 cells were cultured in 1640 medium and B1 serum. Add 1% streptomycin, 10% fetal bovine serum (FBS), and 1% penicillin to the medium. The cells were then placed in a cell incubator containing 5% CO2 and cultured at 37 °C. One day before imaging, the cells were digested into confocal dishes for subsequent experiments.

Cytotoxicity assay

MCF-7 was prepared into a density of 10⁶ cell / mL with culture medium, and then the cells were seeded into 96-well plates. 100ul of medium was added to each well and placed in a cell culture incubator (5% CO2 / 95% Air). Medium culture, after attachment is completed, add a series of probe solutions (0uM, 2.5uM, 5uM, 10uM, 15uM, 20uM, 25uM, 30uM) to 96-well plates, and place them in the cell culture incubator (5% CO2 / 95% Air) Continue incubating for 24h, aspirate the culture medium from the 96-well plate, add 100ul culture medium, and then add 10ul CCK-8 solution to each well, and continue in the cell incubator (5 % CO2 / 95% Air) for 1-4 h, and then take out the absorbance at 450nm on a microplate reader.

Imaging of ONOO⁻ in living cells.

All cell imaging experiments were performed on MCF-7 cells. The excitation wavelength was set at 405 nm, and the blue channel and the red channel collection wavelength ranges were set as 450-510 nm and 610 - 670 nm, respectively.

For detecting exogenous ONOO⁻, probe (10 µM) was first incubated with the cells for 30 min, and
then the cells were washed 3 times with a physiological PBS buffer solution. SIN-1 was then added (100 μM) for another 30 min.

For detecting endogenous ONOO⁻, cells were first incubated with (1 μg/mL) LPS and (50 ng/mL) IFN-γ for 24 h. Then probe (10 μM) was added. The cells were incubated for another 30 min and washed 3 times before imaging.

**Imaging of ONOO⁻ in cells treated by 5-FU.**

Cells were cultured with different amounts of 5-FU for 20 h. Then, probe (10 μM) was added for incubation for another 30 min. The cells were washed 3 times before confocal imaging.
Preparation and Characterization of 1
Phenothiazine (10 mmol) and crushed NaOH (20 mmol) were dissolved in DMSO (20 mL). Then iodoethane (3.9 g, 25 mmol) was added. The mixture was stirred at 65 °C for 9 h under Ar atmosphere. After the reaction was completed, the reaction was cooled down, and was poured into 300 mL water. CH$_2$Cl$_2$ (100 mL × 2) was added for extraction. The combined organic phase was then washed with brine and dried over Na$_2$SO$_4$. After removal of the solvent under reduced pressure by evaporation, the crude product was purified by silica column chromatography with petroleum ether/CH$_2$Cl$_2$ = 5/1 as the eluent to afford a white solid.
