Experiment Section

Materials and Instruments

Analytical grade chemicals were obtained commercially and used without further purification. Elemental analyses (C, H and N) were performed using a PE 2400 II elemental analyzer. FT-IR spectra were recorded with a Nicolet Magna-IR 550 spectrometer in dry KBr disks in the 4000-400 cm\(^{-1}\) range. Thermogravimetric analyses (TGA) were performed using a Mettler TGA thermal analyzer under N\(_2\) atmosphere with a heating rate of 10 °C min\(^{-1}\) in the temperature region of 20-1000 °C. Powder X-ray diffraction (XRD) patterns were collected on a Bruker D8 advance diffractometer using graphite monochromatized Cu K\(\alpha\) radiation. H\(_2\)L was prepared according to a modified literature method.

Single-crystal Structure Determination

Single-crystal X-ray diffraction data for 1-6 were recorded on a Bruker Smart CCD diffractometer with a graphite monochromated Mo K\(\alpha\) radiation (\(\lambda = 0.71073 \text{ Å}\)) at 293 K. The structures of 1-6 were solved by Direct Methods and refined by full-matrix least-squares techniques using the SHELXL-2014 program. Non-hydrogen atoms were refined with anisotropic displacement parameters. The H atoms bonded to C and N atoms were positioned with idealized geometry and refined with fixed isotropic displacement parameters. Compound 6 contain spatially delocalized electron densities (346e for 6) in the lattice and the solvent contribution was then modeled using SQUEEZE in the Platon program suite. SIMU was used to model the atoms of C17 and C18 with similar anisotropic parameters in 2. Spatial disorder in 3 was treated by applying PART-1 and PART 0 in the ins file with the site occupation factors changed to 0.5.

Photoluminescence Sensing Experiments of CrO\(_4^{2-}\) and Cr\(_2\)O\(_7^{2-}\)

The lamellar crystal of compound 6 (1 mg) was ground and the power were dispersed in deionized water (1 mL), and then sonicated for 2 min to get the suspension, which were used for luminescent measurements. The aqueous solutions of Na\(_3\)X (1×10\(^{-3}\) M, X = F\(^-\), Cl\(^-\), Br\(^-\), I\(^-\), CO\(_3^{2-}\), NO\(_3^-\), SO\(_4^{2-}\), Ac\(^-\), CNS\(^-\), ClO\(_4^-\), BrO\(_3^-\), WO\(_4^{2-}\), CrO\(_4^{2-}\), Cr\(_2\)O\(_7^{2-}\)) were prepared for sensing experiments.
Paper-Based Fluorescent Sensor

The filter paper was cut into circles of 1.2 cm in diameter, and then the circles are soaked in the dispersion of compound 6 in DMF for 1 min. The fluorescence-based test papers are dry at room temperature, which are further immersed into different anions aqueous solutions of $\text{CrO}_4^{2-}$ and $\text{Cr}_2\text{O}_7^{2-}$ with different concentrations ($10^{-6}$-$10^{-2}$ M) for 30 s.
