S1 - Materials and syntheses

We first present the materials in Table S1, after which we discuss the protocol used to obtain crystals suitable for single-crystal X-ray diffraction. Besides the two-component structures shown in Table 2, an additional cocrystal dihydrate (c) and salt dihydrate (g) were found.
Table S1 Materials used in the cocrystallization experiments.

Experimental details

a) Cocrystal 4,4’-bipyridine + resorcinol
Colorless needle-like crystals suitable for X-ray diffraction were grown by sublimation of a mixture of 300 mg 4,4’-bipyridine and 230 mg resorcinol. Crystals of the same polymorph can also be grown from solution, but were found to be of lower quality.

b) Cocrystal 1,2-di(4-pyridyl)ethylene + 4-aminobenzoic acid
1,2-di(4-pyridyl)ethylene (40 mg) and 4-aminobenzoic acid (29 mg) were dissolved in ethanol (10 mL). Molecular sieves (Sigma-Aldrich, 3 Å) were used to dry the solution. The solution was subsequently filtered, and left to evaporate in a desiccator flushed with nitrogen gas, yielding colorless needle-like crystals.

c) Cocrystal 1,2-di(4-pyridyl)ethylene + 4-aminobenzoic acid dihydrate
1,2-di(4-pyridyl)ethylene (46 mg) was dissolved in 2 mL acetone and was subsequently filtered, resulting in a slightly yellow solution. This solution was added to a second solution, containing 34 mg 4-aminobenzoic acid in acetone. After slow evaporation of the solvent, colorless plate-like crystals were obtained.

d) Cocrystal 1,2-di(4-pyridyl)ethylene + sebacic acid
1,2-di(4-pyridyl)ethylene (55 mg) and sebacic acid (55 mg) were dissolved in methanol (+- 5 mL). The solution was left to slowly evaporate at ambient conditions. Colorless plate-like crystals suitable for X-ray diffraction were obtained after 9 days.

e) Cocrystal 4,4’-bipyridine + suberic acid
7 mL of methanol was added to a mixture of 29 mg of 4,4’-bipyridine and 29 mg of suberic acid. Subsequently, the mixture was dissolved by heating. Slow evaporation yielded colorless crystals that were suitable for single-crystal X-ray diffraction.

f) Salt 1,2-di(4-pyridyl)ethylene + oxalic acid
1,2-di(4-pyridyl)ethylene (200 mg) and oxalic acid (100 mg) were sublimated. The obtained crystals were, however, too small for single-crystal X-ray diffraction and therefore 20 mg of the sublimated product was dissolved in 50 mL ethanol. This mixture was heated to 70° C and subsequently filtered. Slow evaporation of the solvent to air at room temperature yielded colorless block-shaped crystals.

g) Salt 1,2-di(4-pyridyl)ethylene + oxalic acid dihydrate
1,2-di(4-pyridyl)ethylene (64 mg) and oxalic acid (32 mg) were dissolved in a solution of methanol (2 mL) and water (450 mL). Slow evaporation of the solvent to air yielded yellow needle-shaped crystals after 1 week.

h) Cocrystal 1,2-di(4-pyridyl)ethylene + pimelic acid
A mixture of 1,2-di(4-pyridyl)ethylene (98 mg) and pimelic acid (81 mg) was ground together. Subsequently, 36 mg of the mixture was dissolved in isopropanol (7 mL). Slow evaporation of the solvent at ambient conditions yielded plate-like crystals, containing both coformers (based on 1H-NMR spectroscopy, vide infra). The crystals were suitable for single-crystal X-ray diffraction, but exhibit a modulated structure, which is currently being investigated and will form the topic of a future publication.
The cocrystalline nature of the obtained material is proved by comparing the powder diffraction pattern of the cocrystal to those of the reference compounds (Figure S1). The presence of both coformers and absence of isopropanol in the crystal is confirmed by comparing the $^1$H-NMR spectrum of the dissolved cocrystal to the spectra of the reference compounds (Figure S2).

Figure S1 PXRD measurements of the new cocrystal phase and its reference materials.

Figure S2 $^1$H-NMR spectrum of the new cocrystal phase and its reference materials.
Figure S2 $^1$H-NMR spectra of (a) pimelic acid, (b) 1,2-di(4-pyridyl)ethylene and (c) the cocrystal. The peaks of both reference materials emerge in (c), and no signals of solvent or water are seen. The signal of the hydroxyl moiety proton of pimelic acid in (a) is rather weak and was not observed in (c). Based on integration of the peaks, an equimolar cocrystal stoichiometry is most likely.
j) Cocrystal 1,2-bis(4-pyridyl)ethane + salicylic acid
27 mg of 1,2-bis(4-pyridyl)ethane and 20 mg of salicylic acid were dissolved in ethanol (+- 5 mL) and the solution was left to slowly evaporate at ambient conditions. Colorless needle-like crystals suitable for single crystal X-ray diffraction were obtained after several days.

j) Cocrystal 1,2-di(4-pyridyl)ethylene + 4-nitrobenzoic acid
Equimolar amounts of 1,2-di(4-pyridyl)ethylene (18 mg) and 4-nitrobenzoic acid (16 mg) were added to 5 mL of methanol. The solution was filtered and the filtrate was left to slowly evaporate at ambient conditions, resulting in plate-like crystals.

k) Cocrystal 1,2-di(4-pyridyl)ethylene + phthalic acid
1,2-di(4-pyridyl)ethylene (27 mg) and phthalic acid (26 mg) were dissolved in methanol (+- 5 mL). After slow evaporation of the solvent, orange needle-like crystals were retrieved.

l) Cocrystal 1,2-di(4-pyridyl)ethylene + malonic acid
30 mg of 1,2-di(4-pyridyl)ethylene and 16 mg of malonic acid were added together in methanol (+- 5 mL). Slow evaporation of the solvent resulted in orange block-like crystals suitable for single-crystal X-ray diffraction.

S2 - Single-crystal X-ray structure determinations, ORTEP plots and H-bonding

The crystallographic data of all new structures is presented in Table S2. In some cases, the extent to which proton transfer takes place is not 100% (e.g. i or k). For structure (f), the proton is situated on the aromatic nitrogen of the pyridine moiety, hence indicating a salt. Labeled ORTEP plots (at 50% probability) and hydrogen bonding details are systematically presented at the end of this section. For clarity, minor conformations of the coformers are omitted in the former.
Table S2 Crystallographic data and refinement details of the cocrystals discussed above.

S4 – Predefined lists of common solvents and gases

Solvents and gases are indicated with their chemical names or SMILES code when the former is missing.

Solvents:

1,2-dichlorobenzene
triethylamine
perfluorobenzene
perdeuterocyclohexanone
1-nitropropane
2,3-butanedione
1,3-dichlorobenzene
cyclohexanol
bromoform
heptan-1-ol
ethanethiol
cyclooctane
ethanol
aniline
1,3-dibromobenzene
2-methyl-2-propanol
cycloheptane
1,2,3-trichloropropane
benzyl alcohol
p-xylene
(1,2,3,4,5,6,7,8)-limonene
cyclobutanone
2-ethoxyethyl acetate
1,4-dioxane
diethyl sulfide
n,n'-dimethylpiperazine
1-phenyldecane
heavy water
perdeuteronitromethane
dodecane
butan-2-ol
pentanol
1,3,5-trifluorobenzene
butan-1-ol
benzonitrile
hexane
2,2,2-trifluoroethanol
n-pentane
triethyl orthoformate
4-methylpyridine
dibromo-dideuteromethane
propionic acid
furan
tetradeutero-acetic acid
trifluoroacetic acid
1,1-dichloroethane
cyclooctanamine
cyclopentanone
methyl acrylate
1-bromobutane
acrylic acid
ethyl formate
glycerol
formamide
trans-1,2-dichloroethene
1,2-difluorobenzene
cyclohexanone
diethylamine
hydrogen peroxide
n-butyric acid
acrylonitrile
1,4-pentadiene
adiponitrile
perdeuterotoluene
2-methylheptane
pentan-2-one
2,4-lutidine
dioxolane
n-hexylamine
octafluorotoluene
hexamethyl-disiloxane
2-methylpyrazine
octadeuterofuran
dichloromethane
benzene-d6
2-bromo-2-methylpropane
tert-butylacetate
1,2-dibromobenzene
1,3-propanediol
methyl propanoate
hexafluoroisopropanol
2,2,3-trimethylbutane
O=S1(=O)CCCC1
2-methyltetrahydrofuran
diiodomethane
nitromethane
1,3-dimethyl-2-imidazolidinone
cyclopentane
butyronitrile
1,1,2,2-tetrachloroethane
1,2-bis(dimethylphosphino)ethane
nitric acid
dodecadeuterocyclohexane
tert-amyl alcohol
dimethylformamide
cis-1,2-dichloroethene
3-picoline
