Figure S1: (a) GO nanosheet. (b) Distribution of functional groups on GO nanosheet. The green color is for hydrogen atoms, the black color is for oxygen atoms and the cyan color is for carbon atoms.
Different initial orientation

Figure S2: Three initial configuration with different protein orientation relative to the surface (a) Orientation I(O1) (b) Orientation II(O2) (c) Orientation III(O3). Membrane surface is shown in Vdw and protein is shown in surf representation respectively.
Angle between protein and GO surface

Figure S3: Pictorial representation of angle between the protein and GO surface. GO surface and key residues are shown in licorice representation. Alpha carbons (blue color) and rest of the protein are shown in VDW and New Cartoon representation respectively.
Figure S4: Time evolution of distance between membrane and protein for (a) O2 (b) O3. Time evolution of distance between between L1 and L2 for (c) O2 (d) O3.
Figure S5: Time evolution of interaction energy between membrane and protein for (a) O2 (b) O3. Time evolution of interaction energy between L1 and L2 for (c) O2 (d) O3.
Time evolution of orientation

Figure S6: Temporal evolution of protein orientation relative to the membrane surface for (a) O2 (b) O3

\[ g(r) \] between protein and water molecules

Figure S7: RDF between (oxygen(L1)-oxygen(water) and nitrogen(L1)-oxygen(water) shown in red and blue color respectively for (a) O2 (b) O3 for RO(solid lines) and FO(dashed lines).
**g(r) between protein and ions**

Figure S8: RDF between oxygen(L1)-chloride(ions) and oxygen(L1)-sodium(ions) shown in red and black respectively for (a) O2 (b) O3. RDF between nitrogen(L1)-chloride(ions) and nitrogen(L1)-sodium(ions) shown in blue and black color respectively for (c) O2 (d) O3 for RO(solid lines) and FO(dashed lines).
Force field and parameters

OPLS-AA force field is employed in the simulations which has a functional form as follows:

\[ U_{\text{total}} = U_{\text{bonds}} + U_{\text{angles}} + U_{\text{dihedrals}} + U_{\text{vdW}} + U_{\text{coulomb}} \]  \hspace{1cm} (1)

The first three terms in the equation above represents the bonded interactions, which are given as:

\[ U_{\text{bonds}} = \sum_{\text{bonds}} k_r (r_i - r_{eq})^2 \]  \hspace{1cm} (2)

\[ U_{\text{angle}} = \sum_{\text{angles}} k_\theta (\theta_i - \theta_{eq})^2 \]  \hspace{1cm} (3)

\[ U_{\text{torsion}} = \sum_i \left[ \frac{V_1}{2} [1 + \cos(\phi_i + f_1)] + \frac{V_2}{2} [1 - \cos(2\phi_i + f_2)] + \frac{V_3}{2} [1 + \cos(3\phi_i + f_3)] \right] \]  \hspace{1cm} (4)

torsional energy contribution, where \((V_1, V_2, V_3)\) are coefficients of Fourier series, \(\phi_i\) is the dihedral angle and \((f_1, f_2, f_3)\) are phase angles.

The nonbonded interactions are modeled with coulomb’s law and Lennard-Jones potential for electrostatic and Van der Wal’s contribution as follows:

\[ U_{\text{vdW}} = \sum_i \sum_{j>i} 4\epsilon_{ij} \left[ \left( \frac{\sigma_{ij}}{r_{ij}} \right)^{12} - \left( \frac{\sigma_{ij}}{r_{ij}} \right)^{6} \right] \]  \hspace{1cm} (5)

\[ U_{\text{coulomb}} = \sum_i \sum_{j>i} \frac{q_i q_j}{4\pi\epsilon_0 r_{ij}} \]  \hspace{1cm} (6)

e_{ij} in eq 5 is depth of the potential well, \(\sigma_{ij}\) is the distance between the two atoms at
which the inter-particle potential becomes zero and $r_{ij}$ is the distance between two atoms. The combination rules used for different atom types are $\sigma_{ij} = (\sigma_{ii}\sigma_{jj})^{\frac{1}{2}}$ and $\epsilon_{ij} = (\epsilon_{ii}\epsilon_{jj})^{\frac{1}{2}}$. In eq 6 $(q_i, q_j)$ are partial charges on $i$th and $j$th atom respectively, $\epsilon_0$ is dielectric constant of the medium between charges and $r_{ij}$ is the distance between the atoms.

Table S1: Nonbonded potential parameters and charges for atoms of GO.
