CuSO₄ aqueous solution can react with H₂S and form black CuS precipitation. It is an effective indicator to detect accumulated amount of trace H₂S. In this work, 0.1 mol/L CuSO₄ aqueous solution was prepared as follow: 16.0 g CuSO₄ dissolved with deionized water then 1 ml of sulfuric acid (98%) was added into the solution to prevent the hydrolysis of CuSO₄. Finally, the mixed solution was transferred to 1000 ml volumetric flask and filled with deionized water.

Fig. S2 H₂S in tail gas detected by CuSO₄ aqueous solution over 3Ni7Mo/ZnO-280.
