S1.1 General considerations

Unless otherwise specified, all manipulations were performed under inert atmosphere using standard Schlenk techniques or vacuum techniques\(^1\) in a nitrogen or argon-filled Braun glovebox. All reagents were purchased from Aldrich Chemical Company Inc. or Alfa Aesar Inc. and used as received unless otherwise noted. RhCl\(_3\)\(\times H_2O\) and IrCl\(_3\)\(\times H_2O\) were purchased from Precious Metals Online PMO P/L. For all the air-sensitive and moisture-sensitive manipulations and preparations, acetonitrile, dichloromethane, tetrahydrofuran and pentane were dispensed from a LC Technology solvent purification system and stored under nitrogen or argon atmospheres in glass ampoules fitted with Young’s Teflon valve. The bulk compressed gases argon (> 99.999%) and carbon monoxide (> 99.5%) were obtained from Air Liquide and used as received. Nitrogen gas for Schlenk line operation comes from in-house liquid nitrogen boil-off.

The Ir and Rh complexes studied in this work were synthesized using literature procedures.\(^2\)-\(^4\) \(^1\)H and \(^13\)C\({}^1\)H\} NMR spectra were recorded on Bruker Jones 400, Ripley 500 and DMX 600 spectrometers operating at 400, 500 and 600 MHz (\(^1\)H) respectively and 101, 126 and 150 MHz (\(^13\)C) respectively. \(^1\)H and \(^13\)C\({}^1\)H\} NMR chemical shifts were referenced internally to residual solvent resonances. Unless otherwise stated, spectra were recorded at 298 K and chemical shifts (d), with uncertainties ± 0.01 Hz for \(^1\)H and ± 0.05 Hz for \(^13\)C, are quoted in parts per million, ppm. Multiplicity is abbreviated as: s, Singlet; d, doublet; dd, doublet of doublets; dt, doublet of triplets; t, triplet; q, quartet; dq, doublet of quartets; td, triplet of doublets; m, multiplet; br, broad. Deuterated solvents were purchased from Cambridge Stable Isotopes and used as received. Air sensitive NMR samples were prepared in an inert gas glovebox or by vacuum transfer of deuterated solvents into NMR tubes fitted with a Young's Teflon valve.

Ligand L₁ and L₂, complexes Ir-1, Rh-2 and Rh-3 were reported in literature.⁴

S1.2.2 Synthesis of Ir-2

Ligand L₂ (111.1 mg, 0.225 mmol) was dissolved in CH₂Cl₂ (20 mL) followed by adding Ag₂O (91.4 mg, 0.390 mmol). The reaction mixture was stirred at room temperature overnight. The solid was removed filtering through Celite and washed thoroughly with CH₂Cl₂. The solvent was removed under reduced pressure and re-dissolved with CH₂Cl₂ (20 mL). [IrCp*Cl₄]₂ (90.0 mg, 0.187 mmol) was added into the mixture prior to the addition of Na[BPh₄] (77.0 mg, 0.225 mmol) and the mixture was stirred for 3 hours under N₂. The solvent was concentrated in vacuo to ca. 2 mL and pentane (25 mL) was added. Yellow precipitate forms in solution with vigorous stirring. The solid was dried in vacuo to afford the product as a yellow solid. S1.2.1 Synthesis of the deuterated substrates

The two deuterated versions of the alcohol substrates 2a: C₆H₅CH₂OD (2a-Od₁)⁵ and C₆H₅CD₂OH (2a-Cd₂)⁶ were synthesised according to the literature.

S1.3 General catalysis procedure

S1.3.1 General catalysis procedure for the alkylation of ketone with primary alcohols to deliver mono-alkylated ketones

All the reactions were operated in air. The methyl ketone (1a – 1q) (0.5 mmol), primary alcohol (2a – 2o) (0.5 mmol), Ir-3 (0.005 mmol, 1.0 mol%), KOtBu (0.1 mmol, 0.25 mmol or 0.40 mmol, 0.2 equiv., 0.5 equiv. or 0.8 equiv.) were weighed into a 4 mL glass vial fitted with a close-top melamine cap with PTFE liner and a stirrer bar. Toluene (1.0 mL) was then added to the mixture. The reaction mixture was stirred at room temperature for five minutes until a homogeneous mixture is observed before placing in an oil bath at 100 °C. After 6 hours, the reaction mixture was taken out of the oil bath and immediately cooled in the fridge before the work-up. The insoluble particles (mainly base) were filtered through 3 pipettes blocked with a cotton roll and were washed thoroughly with Et₂O. The crude products were combined and isolated by column chromatography using ethyl acetate/n-hexane (10:1, v/v) as eluent to afford the corresponding desired products.

S1.3.2 General catalysis procedure for the alkylation of ketone with primary alcohols to deliver mono-alkylated alcohols

All the reactions were operated in air. The methyl ketones (0.5 mmol), primary alcohols (1.0 mmol), Rh-2 complex (0.005 mmol, 1 mol%), KOH (1.0 mmol, 2.0 equiv. in respect of ketone) were weighed into a 4 mL glass vial fitted with a close-top melamine cap with PTFE liner and a stirrer bar. Toluene (1.0 mL) was then added to the mixture. The reaction mixture was stirred at room temperature for five minutes until a homogeneous mixture is observed before placing in an oil bath at 120 °C. After 6 hours, the reaction mixture was taken out of the oil bath and immediately cooled in the fridge before the work-up. The insoluble particles (mainly base) were filtered through 3 pipettes blocked with a cotton roll and were washed thoroughly with Et₂O. The crude products were combined and isolated by column chromatography using ethyl acetate/n-hexane (3:1, v/v) as eluent to afford the corresponding desired products.
S1.4 Attempts at catalysing other HB reactions

The following benchmark reactions were conducted under our catalytic conditions in order to test the applicability in other types of HB reactions. However, we only found the reactions between acetophenone and benzylalcohol (eq. 1), benzylalcohol and 1-phenylethanol (eq. 5) were successful.
