Content:

1. Material synthesis
2. Characteristic properties of materials

1. Material synthesis

1.1. Materials

All the chemical reagents for synthesis materials and substrate of reaction were purchased from Aladdin chemical and used as received without any further purification. The solvents, such as methanol etc., were directly used after purchase from Sinopharm Chemical.

1.2. Thermochemical synthesis

The alumina ceramic boat (30x60x15 mm) containing template materials (250-300 mg of ZIFs) transferred into a quartz tube (OD 60mm, 1000mm), which installed in the muffle furnace (TL 1200, Nanjing Bo Yun Tong Instrument Technology Co.Ltd.). The system purged with Ar underflow rate 50 cm\textsuperscript{3}\textsuperscript{-min\textsuperscript{-1}} (mass flow controller, S48-32HMT, Nanjing Bo Yun Tong Instrument Technology Co.Ltd.) for 30 min before ramping temperature. The thermal treatment process was programmable controlling temperature with an external thermocouple detector under the heating rate of 10°C\textsuperscript{-min\textsuperscript{-1}}. The target temperature was kept for curtain time before natural cooling to room temperature. Additional, the system was continuously flowing with 50 cm\textsuperscript{3}\textsuperscript{-min\textsuperscript{-1}} of Ar until the correcting product. The synthesized materials were stored in a desiccator to avoid the moisture adsorption for further used in application or characterization. The synthesized materials were weight based on the weight of template material, which higher weight loss observed in the higher temperature.
2. Characteristic properties of materials

Figure S1. The CO$_2$ (a) and CH$_4$ (b) adsorption at 273K on T-ZIF-67
