**General information**

Flasks and all equipment used for the generation and reaction of moisture-sensitive compounds were dried by electric heat gun under nitrogen. Unless specified, all reagents were used as received without further purifications. Anhydrous THF was obtained by distillation over LiAlH₄, followed by distillation over Na-benzophenone; benzaldehyde was distilled under vacuum. Flash column chromatography was performed over silica gel (40-63 μm, 230-400 mesh); Rf values refer to TLC carried out on silica gel plates. ¹H NMR and ¹³C NMR spectra were recorded on a Jeol ECZR600, in CDCl₃, using residual solvent peak as an internal standard (CHCl₃, ¹H: 7.26 ppm, ¹³C: 77.16 ppm). NMR spectra of DESs were recorded in a capillary tube, using D₂O as locking solvent. Multiplicity is reported as follows: s (singlet), d (doublet), t (triplet), q (quartet), quin (quintet), sext (sextet), m (multiplet), br (broad). GC-MS spectra were recorded at an ionizing voltage of 70 eV.
Synthetic procedures

General procedure for the Nazarov cyclization in DES

A vial was charged with the dienone substrate (0.2-0.5 mmol), then the DES (5 g per mmol of substrate) was added and the mixture was stirred at 60 °C for 16 h. Water was added and the mixture was extracted three times with cyclopentyl methyl ether (CPME); the combined organic layers were dried over anhydrous Na₂SO₄, filtered and the solvent was evaporated under reduced pressure. When required, the crude product was purified by flash column chromatography.

Procedure for DES recycling: a vial was charged with the dienone 1a (1.0-4.0 mmol), then ChCl/malic acid 1:1 (5 g or 1 g per mmol of substrate) was added and the mixture was stirred at 60 °C for 16 h. Water was added, causing the precipitation of the product. The solid product was recovered by filtration, while water was evaporated under reduced pressure to afford the eutectic mixture, which was used for the next reaction cycle.

2,5-dimethyl-3,4-diphenylcyclopent-2-en-1-one (2a)

Synthesized according to the general procedure with ChCl/malic acid 1:1. White solid, 92% yield, trans/cis ratio 83:17. R_f 0.25 (PE/Et₂O 9:1). trans-2a ¹H NMR (600 MHz) δ (ppm): 7.34-7.24 (m, 5H), 7.23-7.19 (m, 2H), 7.15-7.11 (m, 1H), 7.09-7.06 (m, 2H), 3.98 (quin, 1H, J = 2.2 Hz), 2.41 (qd, 1H, J = 7.3, 2.8 Hz), 2.03 (d, 3H, J = 2.0 Hz), 1.36 (d, 3H, J = 7.5 Hz). ¹³C NMR (150 MHz) δ (ppm): 211.1 (Cq), 167.2 (Cq), 142.2 (Cq), 136.9 (Cq), 135.3 (Cq), 129.1 (CH), 128.9 (CH), 128.5 (CH), 128.4 (CH), 127.7 (CH), 126.9 (CH), 56.5 (CH), 51.4 (CH), 15.4 (CH₃), 10.3 (CH₃). Synthesis of the substrates

General procedure for the aldol condensation of 3-pentanone and aldehydes

3-pentanone (1.0 eq, 10-20 mmol) was mixed with the aldehyde (2.5 eq) and the mixture was added to a flask already containing KOH (2.5 eq) in 2:1 MeOH/H₂O (1.0 M towards 3-pentanone). The mixture was stirred at reflux overnight, then it was cooled down. A 1.0 M solution of HCl was added until the pH was 7. The mixture was extracted three times with DCM; the combined organic layers were dried over anhydrous Na₂SO₄, filtered and the solvent was evaporated under reduced pressure. The crude product was recrystallized with MeOH to afford pure dienone.

\]

A solution of 3,4-dihydropyran (1.0 eq, 5 mmol) in anhydrous THF (1.0 M) was cooled down to -78 °C. t-BuLi (1.1 eq, 1.7 M solution in pentane) was added dropwise and the mixture was allowed to warm to 0 °C and stirred for 30 min at that temperature. Then, the mixture was cooled down again to -78 °C and the α,β-unsaturated aldehyde (1.1 eq) was added. The mixture was allowed to warm to 0 °C and it was stirred for 10 min, then H₂O was added and the mixture was extracted three times with EtOAc; the combined organic layers were dried over anhydrous Na₂SO₄, filtered and the solvent was evaporated under reduced pressure. The crude product was used directly for the subsequent oxidation.

To a solution of Dess-Martin periodinane (1.1 eq) in DCM (0.3 M towards the substrate), pyridine (5.0 eq) was added. The mixture was stirred for 5 min, then the alcohol substrate (1.0 eq) in solution of DCM was added. The mixture was stirred for 30 min, then a 3M NaOH solution was added and the mixture was stirred for 10 min before extracting three times with DCM. The combined organic layers were washed with brine, dried over anhydrous Na₂SO₄, filtered and the solvent was evaporated under reduced pressure. The crude product was purified by flash column chromatography to afford pure pyranyl dienone.

Synthesis of 1-(benzo[d][1,3]dioxol-5-yl)propan-1-one

A solution of piperonal (1.0 eq, 15 mmol) in anhydrous THF (0.3 M) was cooled down to -78 °C. EtMgBr (1.5 eq, 3.0 M solution in Et₂O) was added dropwise and the mixture was stirred for 30 min at that temperature. Then, the mixture was allowed to warm to room temperature. A 10% AcOH solution was added and the mixture was extracted three times with Et₂O; the combined organic layers were washed with water, dried over anhydrous Na₂SO₄, filtered and the solvent was evaporated under reduced pressure. The crude product was used directly for the subsequent oxidation.

To a solution of the alcohol (1.0 eq) in DCM (0.25 M), pyridinium chlorochromate (1.3 eq) was added portionwise. The mixture was stirred until complete consumption of the starting material (GC check, 6 h), then it was filtered through a pad of celite and a pad of MgSO₄. The solvent was evaporated.

**Preparation of the deep eutectic solvents**

All the DESs were prepared according to literature procedures. The general procedure involves mixing of the two (or three) components of the mixture and stirring at a certain temperature until a clear homogeneous liquid is formed. Then, the mixture is stirred for another 20-30 min and finally cooled down to room temperature.

E-factor calculation

The E-factor for the two-cycles, gram-scale reaction of 1a in ChCl/malonic acid 1:1 was calculated as follows:

\[ e - factor = \frac{g_{DES} + g_{H_2O}}{g_{2a}} = \frac{4 + 35}{2} = 19.5 \]

25 g of H₂O were employed for dissolving the DES at the end of the reaction and rinsing; 15 g out of 25 g of H₂O were recovered from the evaporation and used for the same purpose in the second cycle.
