Determination of log *P* by RP-UPLC studies

In a typical experiment, the retention time (t_r) of each compound is determined on a minimum of five different organic modifier-water mobile phase ratios. For each mobile phase composition, the retention factor is calculated according to the formula:

$$\log k = \log \left(\frac{t_R - t_{del} - \frac{V_{ext}}{F}}{t_0 - t_{del} - \frac{V_{ext}}{F}} - 1 \right) \quad [\text{eq. SI-1}]$$

where t_r and t_0 are the retention time of the solute and the unretained compound (uracil), respectively, t_{delay} is the injection delay, V_{ext} is the extra-column volume and F is the flow rate of the mobile phase.

Extrapolated retention factors ($\log k_w$) is obtained by linear extrapolation to 100% water, from the isocratic $\log k$ values plotting as a function of the mobile phase composition.

The correlation between $\log k$ and the composition of mobile phase for **clofibric acid**, **gemfibrozil** and compounds **1-5** is reported in **Figure SI-1**.

A calibration curve was previously determined for the adopted chromatographic system using methanol as mobile phase based on the $\log k_w$ measurements of 52 compounds with well-known $\log P$ resulting in the following linear correlation:

$$\log K_w = 0.83(\pm 0.02) * \log P + 0.25(\pm 0.07) \quad [\text{eq. SI-2}]$$

$$N = 52; R^2 = 0.99; S = 0.17; F = 4968$$

Thus, accordingly to this equation, the $\log P$ for our tested compounds was determination from the experimental measured $\log k_w$ (**Table SI-1**).

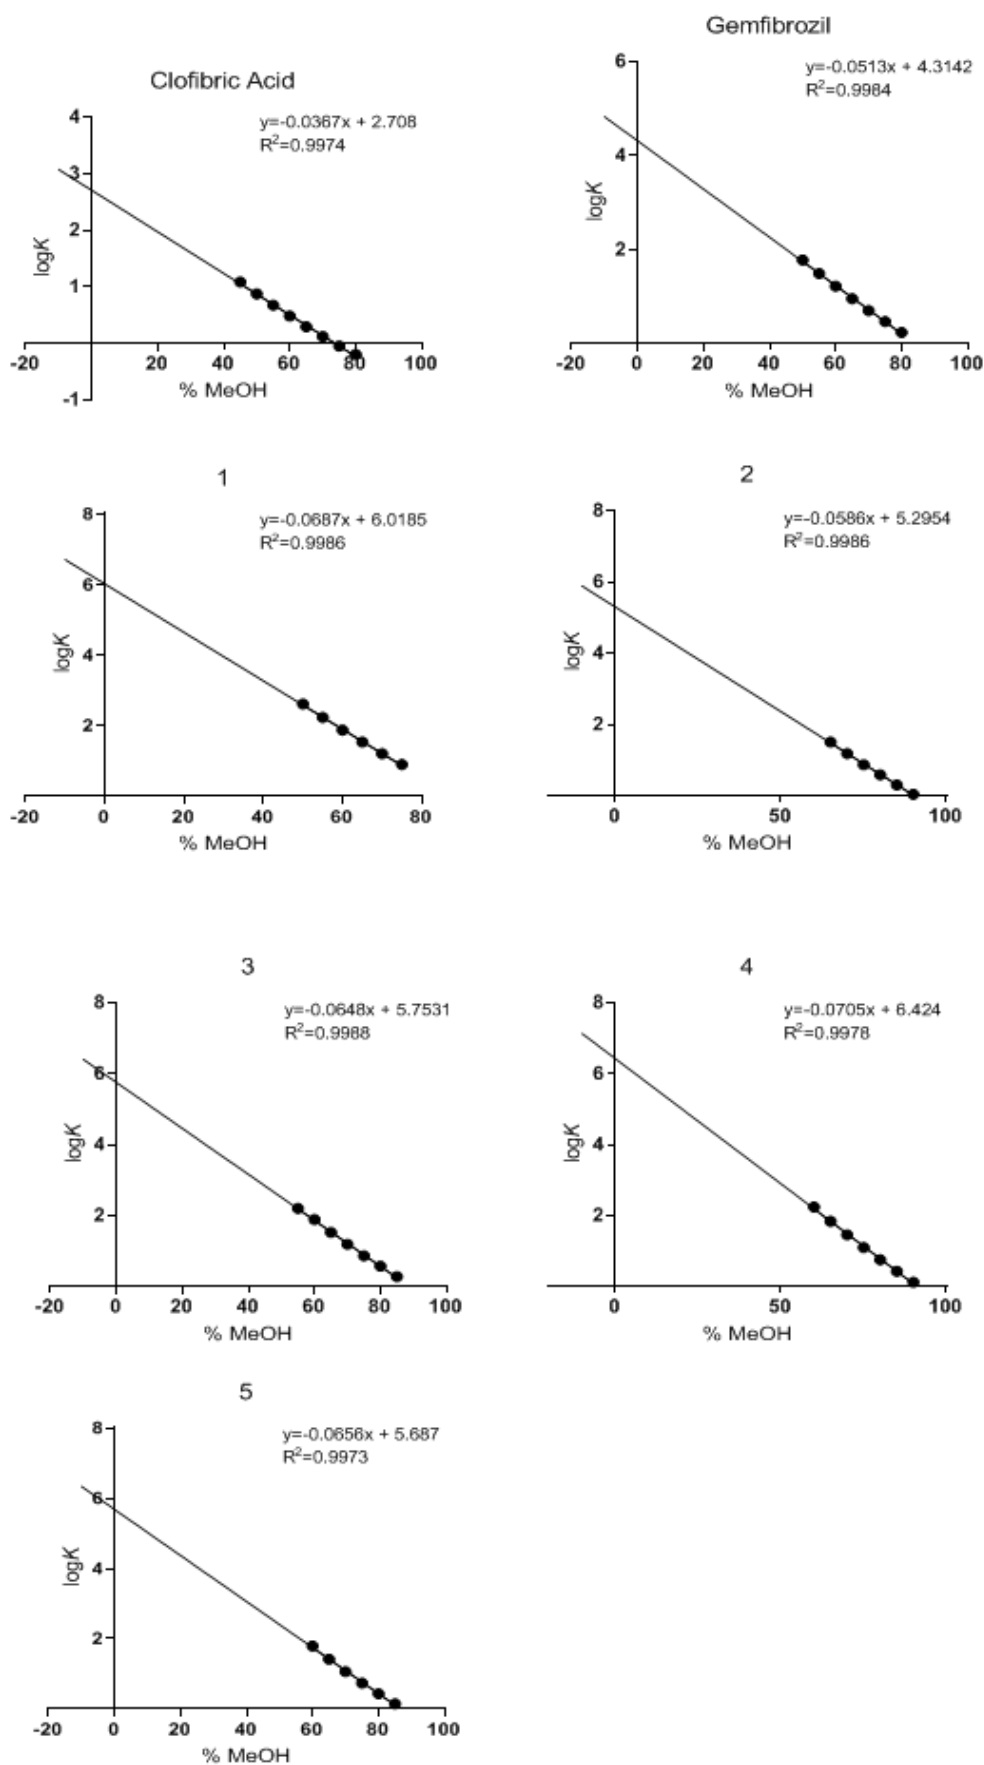

Figure SI-1. Extrapolation of the $\log k_w$ from the correlation between $\log k$ and different composition of mobile phase by UPLC analysis.

Table SI-1. Determination of $\log P$ from $\log k_w$ for clofibric acid, gemfibrozil and compounds **1-5**, accordingly to **eq. SI-2**.

| Cmpd | $\log k_w$ | $\log P$ | SD |
|-----------------------|------------------------------|----------------------------|-----------|
| Clofibric Acid | 2.707 | 2.96 | 0.22 |
| Gemfibrozil | 4.314 | 4.90 | 0.28 |
| 1 | 6.018 | 6.95 | 0.36 |
| 2 | 5.295 | 6.08 | 0.35 |
| 3 | 5.753 | 6.63 | 0.34 |
| 4 | 6.425 | 7.44 | 0.41 |
| 5 | 5.687 | 6.55 | 0.40 |

Quantification of clofibric acid, gemfibrozil and compounds 1-5 concentrations by UV spectroscopy

The quantification of clofibric acid, gemfibrozil and compounds **1-5** concentrations in solubility and PAMPA assays was performed by UV spectroscopy.

UV spectra were acquired on a UV Reader Powerwave TM spectrometer (BioTek Instrument, Inc., Winooski, VT, USA) using 96-well quartz plate (Hellma GmbH&co, Müllheim, Germany).

The full UV spectra for each compound was acquired in the 200-600 nm range and the λ_{\max} was determined (Figure SI-2).

The calibration curves were constructed by plotting the absorbance values determined at the respective λ_{\max} against the micromolar concentration of the analyte in water, containing the 5% of DMSO. The concentration ranges were found to be linear in the 2.0–250.0 μM range for clofibric acid, gemfibrozil and compound **3**, in the 2.0-125.0 μM range for compounds **2** and **4** and in the 2.0–62.9 μM range for compounds **1** and **5** (Figure SI-3).

Calibration curves were used for the determination of the concentration of the analytes in the solubility and PAMPA assays.
