**General Information:** The reactions were monitored by TLC carried out on Merck silica gel (60 F254) by using UV light as visualizing agent and 5% vanillin in 10% H₂SO₄ and heat as developing agents. Baker silica gel (particle size 0.040–0.063mm) was used for flash chromatography. Hydrogen nuclear magnetic resonance spectra (¹H NMR) were obtained at 400 MHz on Bruker Avance III HD spectrometer. Spectra were recorded in CDCl₃ solutions. Chemical shifts are reported in ppm, referenced to tetramethylsilane (TMS) as the external reference. Coupling constants (J) are reported in Hertz. Abbreviations to denote the multiplicity of a particular signal are s (singlet), d (doublet), t (triplet), q (quartet), quin (quintet), sex (sextet) and m (multiplet). Carbon-13 nuclear magnetic resonance spectra (¹³C NMR) were obtained at 100 MHz on Bruker Avance HD III spectrometer. Chemical shifts are reported in ppm, referenced to the solvent peak of CDCl₃. Low-resolution mass spectra were obtained with a Shimadzu GCMS-QP 2010 Plus mass spectrometer. High-resolution mass spectra (HRMS) were recorded on a Bruker Micro TOF-QII spectrometer 10416.

**General procedure for the synthesis of alkynyltellurides 3a-s:** To a 5 mL Schlenk tube equipped with a small magnetic stirring bar, containing a solution of an appropriated alkyne (1a-m; 0.5 mmol) in DMSO (1.5 mL), K₃PO₄ (5 mol%) and the corresponding diorganyl ditellurides (2a-f; 0.25 mmol) were added. The mixture was stirred at 25 °C for the time indicated in Table 2. The reaction mixture was then diluted with ethyl acetate (30 mL) and washed with distilled H₂O (3 x 30 mL). The organic phase was dried with MgSO₄ and concentrated in vacuum and the crude product was purified by column chromatography on silica gel using a hexane or a mixture of hexane/ethyl acetate as the eluent to afford the desired products.
