General experimental

Analytical thin layer chromatography (TLC) was carried out using silica gel 60 F254 pre-coated plates. Visualization was accomplished with UV light (for compounds 2a-g, 2f', 4, 6') or I₂ stain (for compounds 2i-p, 8). Silica gel 100-200 mesh size was used for column chromatography using the combination of ethyl acetate and petroleum ether as an eluent. Wherever appropriate, solvents and reagents were purified and dried prior to use following the guidelines of Perrin and Armarego¹ and Vogel². All the reagents and solvents were purchased from Spectrochem India Ltd. The photocatalysts were purchased from Sigma-Aldrich and were used as received without further purification. CCl₃Br was purchased from Sigma-Aldrich. All the reactions were carried out in borosilicate glass round bottomed flasks and no optical filters were used. Compound names were determined using ChemBioDraw Ultra (v.12) software. IR spectra were recorded on a Perkin-Elmer Spectrum Two FT-IR spectrometer using neat condition and are reported in reciprocal centimeters (cm⁻¹). NMR spectra were recorded on a Bruker 400 Ultra Shield in CDCl₃ as deuterated solvent. Proton nuclear magnetic resonance (¹H NMR) spectra were recorded at 400 MHz. Chemical shifts were recorded in parts per million (ppm, δ) relative to tetramethyl silane (δ 0.00). ¹H NMR splitting patterns are designated as singlet (s), broad singlet (bs), doublet (d), triplets (t), quartets (q), quintets (qnt), sextets (sxt) or multiplets (m). Carbon nuclear magnetic resonance (¹³C NMR) spectra were recorded at 100 MHz. High Resolution Mass Spectra (HRMS) were obtained on an Agilent Technologies 6530 Accurate-Mass Q-TOF LC/MS spectrometer using electron spray ionization (ESI) technique.

Experimental procedure

In a 25 mL double necked round bottom flask equipped with a magnetic stirring bar and an air balloon, 4-phenylbutan-1-ol (1a) (300 mg, 2.0 mmol), photocatalyst Ru(III)(bpy)₃Cl₂ (15 mg, 0.02 mmol), CCl₃Br (793 mg, 4.0 mmol) and dimethylsulfoxide (3.0 mL) were mixed at room temperature. The reaction mixture was irradiated by keeping it over a circular blue LED array (λ=445 nm, diameter 5 cm and kept below at 1 cm distance from the round bottom flask) fitted over a magnetic stirrer for 20 hrs and the progress of the reaction was monitored by TLC. After completion, 10 mL water and 10 mL ethyl acetate were added to the mixture and the organic layer was extracted with a separating funnel. The organic layer was washed with 3x 5 mL water and was kept over anhydrous Na₂SO₄. Then the organic layer was concentrated under reduced pressure and the crude product was purified by column chromatography using 100-200 mesh silica gel and eluting with 1-3% ethyl acetate in hexanes solvent mixture to afford pure bis(4-phenylbutoxy)methane (2a) as a colorless thick liquid with a distinguished aroma in 71% yield.
(222 mg). For other substrates (1b-p, 3, 5 and 7), the general experimental procedure as exemplified for 2a was followed.
