Materials

\(N, N\)-Dimethylformamide dimethyl acetal, potassium phthalimide, 4,4'-dimethoxytrityl chloride, triethylamine, \(N, N\)-dimethyl-4-aminopyridine, 3-chloro-1-propanol, 3-amino-1-propanol were received from Wako Chemicals and used without further purification. 2-cyanoethyl \(N, N\)-diisopropylchloro phosphoramidite, D-threoninol (97%), hydrazine monohydrate, 2,2'-bipyridine-5,5'-dicarboxylic acid, 4-amino-1-butanol were purchased from Sigma-Aldrich Chemicals Co. and used as received. \(N, N\)-Diisopropylethylamine was purchased from Nacalai and used as received. 6-Amino-1-hexanol, 6-chloro-1-hexanol were obtained from TCI. Glen-Pak™ DNA and RNA cartridges columns are purchased at Glen research and used. All other chemicals and solvents were purchased from Sigma-Aldrich Chemicals Co., Wako Pure Chemical Ind. Ltd., TCI, or Kanto Chemical Co. Inc. and used without further purification and synthetic oligonucleotides were obtained from Sigma Genosys. Water was deionized (specific resistance of \(\geq 18.0 \text{ MW cm at } 25^\circ\text{C}\)) by a Milli-Q system (Millipore Corp.).

Methods and Equipment

NMR spectra were obtained on a JEOL JNM ECA-600 spectrometer operating at 600 MHz for \(^1\text{H}\) NMR and 150 MHz for \(^{13}\text{C}\) NMR in CDCl\(_3\) unless otherwise noted. Flash column chromatography was performed employing Silica Gel 60 (70–230 mesh, Merck Chemicals). Silica-gel preparative thin-layer chromatography (PTLC) was performed using plates from Silica gel 70 PF\(_{254}\) (Wako Pure Chemical Ind. Ltd.). Enantiomeric excess (\(ee\)) determinations were performed by HPLC analysis (Chiralcel AD-H, OD-H) using UV-detection. DNA concentrations were measured by Nanodrop ND-1000 spectrophotometer. Rotary mixing of reaction suspension was performed by Intelli-Mixer RM-2 (Elmi).
Synthetic routes for intrastrand bipyridine ligands and non-binding steric moieties

Synthesis of bi-linker conjugated bipyridine ligand derivatives ("X, n=3, 6) and triethylene glycol linkers (E) were followed by previous reported papers\cite{1,2}

Scheme S1. Synthesis bi(propyl)-linker conjugated biphenyl derivative (3P). Reagents and conditions: (a) 3.0 equiv of PyBOP, 5.0 equiv of iPr\textsubscript{2}NEt, DMF, rt, 4 h, 76% yield; (b) 1.5 equiv of 2-cyanoethyl N,N-diisopropylchlorophosphoramidite, 3.0 equiv of iPr\textsubscript{2}NEt, DCM, rt, 1 h. This product was used in the subsequent step without further purification.

Table S1. Analytical HPLC profile of newly synthesized oligonucleotides (ODN8, ODN12, ODN13, ODN15, ODN16, ODN17); For HPLC analysis, COSMOSIL 5C18 AR-II (Nacalai Tesque, Inc., Kyoto, 150 × 10 mm id), a linear gradient of 3 to 30% acetonitrile over 30 min at a flow rate of 3.0 mL/min. 50 mM ammonium formate (pH 6.6) was used as a buffer on 254 nm.

Enantioselective hydration of α,β-unsaturated ketones

The ee of the product was determined on a Daicel Chiralcel AD-H, OD-H column with a solvent mixture of suitable polarity. Various ratios of Hexane and 2-propanol mixed solution was used with a flow rate of 1.0 mL/min or 0.5 mL/min. The conversion of the chiral products was calculated based on the below formula

\[
\text{conversion (\%)} = \frac{A(v.s.)_{pd}}{A(v.s.)_{sm} + C + A(v.s.)_{pd}} \times 100
\]
Here, $A_{(v.s.)pd}$ is the total peak area of the product of the reaction, $A_{(v.s.)sm}$ is the peak area of the starting material and $C$ is the correction factor determined from a calibration curve.

<sup>a</sup> Experiments were carried out using 3.3 mM α,β-unsaturated 2-acyl imidazole, 0.13 mM DNA, and 0.1 mM CuSO<sub>4</sub> (or 0.1mM Cu(dmbpy) complex) at 5 °C in 20 mM MES buffer (pH 5.5) for 1 day. The conversion and enantioselectivities were determined by chiral HPLC analysis. <sup>b</sup> Optimized reaction conditions with 4 mol% of single-strand modified DNA and 3 mol% of Cu(II) ion in 20 mM MES buffer (pH 5.5). <sup>c</sup> Reaction conditions with 4 mol% of DNA and 4 mol% of Cu(dmbpy) complexes in 20 mM MES buffer (pH 5.5).

UV Spectroscopy study

1) CD Spectroscopy.

CD spectra of oligonucleotide solutions collected in 0.5-nm steps from 360 to 220 nm were measured using JASCO J-805LST Spectrometer in a 1-cm quartz cuvette. The buffer and concentrations of MES were the same as for Fluorescence measurement. Each spectrum shown is the average of two individual scans.

2) T<sub>m</sub> Measurement (UV-melting)

Melting temperature was determined by measuring changes in absorbance at 260 nm as a function of temperature using a JASCO V-650 UV/VIS spectrophotometer. JASCO PAC-743R equipped with a high performance temperature controller and micro auto eight-cell holder.
Absorbance was recorded in the forward and reverse direction at temperatures from 5 to 95 °C at a rate of 0.5 °C/min. The melting samples were denatured at 95 °C for 3 min and annealed slowly to RT then stored at 5 °C until experiments were initiated. All melting samples were prepared in a total volume of 150 μl containing 3.3 μM of each strand oligonucleotide, 2.5 μM CuSO₄, 20 mM MES buffer (pH 5.5) and 100 mM NaCl.

Molecular Modeling Studies

Molecular modeling was carried out using the MOE (Molecular Operating Environment) software package. DNA duplexes containing an intrastrand bipyridine ligand were constructed and minimized with amber force field parameters, a distance-dependent dielectric constant of $\varepsilon = 4r$ (where, $r$ is the distance between two atoms) and convergence criteria having an RMS gradient of less than 0.001 kcal mol$^{-1}$ Å. For energy minimization water molecules were added to produce distance of 10 Å from the solute to droplet sphere boundaries and sodium counter ions were added to neutralize the system.
