General information
Reactions requiring anhydrous conditions were carried out under a nitrogen atmosphere using oven-dried glassware. Anhydrous CH$_2$Cl$_2$ was freshly distilled from CaH$_2$ under nitrogen, anhydrous THF was freshly distilled from sodium metal and benzophenone under nitrogen, anhydrous toluene was freshly distilled from sodium metal under nitrogen. Anhydrous methanol was distilled from activated magnesium under nitrogen. Column chromatography was conducted using silica gel (230-400 mesh). All chemicals were obtained from commercial sources and used as received without purification unless indicated otherwise. [18]-Crown-6 were recrystallized according to the literature procedure. \(^1\) H NMR spectra were recorded at 500 or 400 MHz in CDCl$_3$ solutions and \(^13\)C{H} NMR were recorded at the corresponding frequency. Chemical shifts are given in ppm, referenced to the residual chloroform (7.26 ppm, \(^13\)C-spectrum: 77.16 ppm). Coupling constants are in Hz. FTIR spectra were recorded using KBr plates. Only the most intense and/or diagnostic IR peaks are reported. High-resolution mass spectrometry (HRMS) measurements were performed using ESI-TOF employing the electrospray ionization technique (ESI) in methanol solutions.

General procedure for t-BuOK catalyzed oxa-Michael addition. A solution of the alcohol (0.1 mmol) in anhydrous THF (1 ml) was added dropwise by syringe to a solution of t-BuOK in THF (0.2 eq.) at -78°C, placing the needle against the wall of the round-bottom flask. The mixture was stirred for 45 mins at -78 °C then quenched by adding aqueous NH₄Cl solution (1 ml). The mixture was allowed to warm to room temperature and diluted with diethyl ether (2 ml) while stirring. The organic phase was separated, and the aqueous phase was extracted with diethyl ether (2 ml) twice. The combined organic phases were dried (Na₂SO₄), then filtered through a silica/Celite pad washing with diethyl ether, and finally concentrated in vacuo to yield a yellow oil.
