1. General Remarks

**NMR measurements** were performed on a Bruker AVANCE II 300 MHz, a Bruker AVANCE III 500 MHz and a Bruker AVANCE III 600 MHz spectrometer, equipped with a Bruker Cryoplatform. The chemical shifts are reported in parts per million (ppm) relative to the solvent residual peak of CDCl₃ (¹H: 7.26 ppm, singlet; ¹³C: 77.16 ppm, triplet) DMSO-ᵈ₆ (¹H: 2.50 ppm, quintet; ¹³C: 39.52 ppm, heptet) or benzene-ᵈ₆ (¹H: 7.16 ppm, singlet; ¹³C: 128.06 ppm, triplet). The atom numbering is according to the longest linear carbon-chain.

**LC-ESI-HRMS** measurements were carried out on an Accela UPLC system (Thermo Scientific) coupled with an Accucore C18 column (100 x 2.1 mm, particle size 2.6 μm) combined with a Q-Exactive mass spectrometer (Thermo Scientific) equipped with an electrospray ion (ESI) source.

**Chiral analytical HPLC** was performed on a Knauer Smartline HPLC system using a Phenomenex Lux Cellulose-1 column (250 x 4.6 mm, particle size 5μm, pore diameter 1000 Å).

**Flash chromatography** was performed on Biotage Isolera™ Prime. Pre-coated silica gel 60 F254 plates (Merck) were used for TLC with detection via UV, KMnO₄, phosphomolybdic acid/CeSO₄ or anisaldehyde stains.

**IR spectra** were recorded on an FT/IR-4100 ATR spectrometer (JASCO).

**Optical rotations** were recorded in the respective solvent on a P-1020 polarimeter (JASCO).

Methanol (VWR, Germany); water (Millipore, Germany) for analytical and preparative HPLC, formic acid (Carl Roth, Germany); acetonitrile (VWR as LC-MS grade). Titanium isopropoxide was dried in high vacuum and dissolved in dry toluene prior to use. Dicyclohexylcarbodiimide (DCC) was purchased from Fluorochem and molten under vacuum prior to use. All other reagents and solvents for synthesis were purchased from Acros Organics, Alfa Aesar, Carbolution Chemicals, Carl Roth, Fluorochem, Sigma Aldrich, TCI, Th. Geyer and VWR and used without further purification.
2. Synthesis of Fatty Acids

13-Methyltetradecanol (A)

To a solution of 11-bromoundecan-1-ol (2.50 g, 9.95 mmol) in THF (50 mL) at -78 °C was dropped a solution of iso-butyl magnesium bromide (12.5 mL, 2 M solution in Et₂O, 2.50 equiv.), stirred for 15 min and treated with a solution of Li₂CuCl₄ (0.1 M in THF, 5 mL, 0.05 equiv.). After stirring at -78 °C for 1 h the mixture was allowed to warm to r.t. overnight. The dark blue mixture was then cooled to 0 °C, i-PrOH and NH₄Cl-solution were added and extracted with TBME (3x). The combined organic phases were washed with brine, dried over MgSO₄, filtered and the volatiles removed in vacuo to yield alcohol A as a white wax (2.34 g, ca. quantitative), which was used in the next step without further purification.

¹H NMR (500 MHz, CDCl₃) δ 3.58 (t, J = 6.7 Hz, 2H, 1-H), 1.61 – 1.45 (m, 3H, 2-H to 13-H), 1.36 – 1.20 (m, 19H, 3-H to 12-H), 1.16 – 1.08 (m, 2H, 12-H), 0.84 (d, J = 6.7 Hz, 6H, 14-H, 15-H) ppm.

The analytical data is consistent with literature reports.⁴

10-Methylundecanol (B)

To iodine-activated Mg-turnings (15.3 g, 627 mmol, 4.00 equiv.) was added iso-propylbromide (36.8 mL, 392 mmol, 2.50 equiv.) in THF (500 mL) at once until the Mg-turnings were covered and an exothermic reaction could be monitored. The remaining bromide solution was added in a manner, that a slight reflux was sustained. Upon completed addition the flask was lowered into a pre-heated oil bath and refluxed for 5 d until titration vs. iodine in LiCl-solution (0.5 M in THF) confirmed the concentration of 0.8 M. The mixture was then cooled to r.t and additional THF (250 mL) was added. Cooling of the mixture to -78 °C and dropwise addition of 8-bromooctanol (35.0 g, 157 mmol) in THF (250 mL) were followed by stirring at -78 °C for 15 min and addition of Li₂CuCl₄ (16 mL, 0.1 M solution in THF, 16.0 mmol, 0.01 equiv.). Stirring was continued at -78 °C for 1 h followed by warming to r.t. over night. Cooling to 0 °C and careful addition of i-PrOH, NH₄Cl solution and 5 M aq. HCl resulted in a color change from blue to yellow. After complete consumption of remaining Mg-turnings the solvent was evaporated until ~300 mL remain, the residue was extracted with TBME (3x) and the combined organic phases were washed with brine, dried over MgSO₄, filtered and the volatiles removed in vacuo and filtered over a pad of silica to yield alcohol B as a brownish oil (30.0 g, ca. quantitative), which was used in the next step without further purification.
\(^1\)H NMR (300 MHz, CDCl\(_3\)) δ 3.64 (t, \(J = 6.6\) Hz, 2H, 1-H), 1.70 – 1.37 (m, 3H, 2-H to 10-H), 1.39 – 1.16 (m, 14H, 3-H to 8-H), 1.23 – 1.04 (m, 2H, 9-H), 0.86 (d, \(J = 6.6\) Hz, 6H, 11-H, 12-H) ppm.

\(^1\)C NMR (75 MHz, CDCl\(_3\)) δ 63.3 (t, C-1), 39.2 (t, C-2), 33.0, 30.1, 29.8, 29.6 (4t, C-3 to C-9), 28.1 (d, C-10), 27.6, 25.9 (2t, C-3- to C-9), 22.8 (q, C-11, C-12) ppm.

The analytical data is consistent with literature reports.[2]

HCl using a pad of Celite, and thoroughly washed with water and TBME. The filtrate was extracted with TBME (3x), the combined organic phases were washed with brine, dried over MgSO\(_4\), filtered and the volatiles removed *in vacuo* to yield the crude carboxylic acid, which was used without further purification.

The mixture was allowed to warm to r.t., stirred for 3 h, poured into ice-cooled water and extracted with CH₂Cl₂ (3x). The combined organic phases were washed with sat. NaHCO₃ solution (careful! strong gas development!) and the aqueous phase thereof reextracted with CH₂Cl₂ and combined with the previous organic phase. Washing of the combined organic phases with brine, drying over MgSO₄, filtration and removal of the volatiles in vacuo yielded the crude alkynone, which was purified by flash-chromatography.

After stirring at r.t. for 30 min, AcOH (5 \(\mu\)L, 87 \(\mu\)mol) was added, the volatiles removed *in vacuo*, the residue filtered over a silica pad and washed with EtOAc. Removal of the volatiles *in vacuo* yielded the crude product, which was purified via flash chromatography.

**General procedure 9 (GP9) for the hydrozirconation**

To a suspension of Schwartz’s reagent (1.10 equiv.) in CH\textsubscript{2}Cl\textsubscript{2} (1.0 mL/mmol) at 0 °C was dropped TBS-alkynol (1.10 equiv.) and the initially off-white suspension stirred at r.t. to turn into a yellowish solution. After 3 h the mixture was cooled to the temperature indicated and Et\textsubscript{2}Zn (1.20 equiv., 0.9 M solution in hexanes) as well as the additives were added dropwise. Then Garner’s aldehyde (1.00 equiv.) dissolved in CH\textsubscript{2}Cl\textsubscript{2} (1.0 mL/mmol) was added. Further stirring for the time indicated was followed by carefully stopping the reaction by addition of Na/K-tartrate solution. The milky suspension was filtered through a pad of Celite and thoroughly washed with H\textsubscript{2}O and EtOAc. The filtrate was extracted with EtOAc (3x) and the combined organic phases were washed with brine, dried over MgSO\textsubscript{4}, filtered and the volatiles removed *in vacuo* to yield the crude product which was purified by flash chromatography.

To a solution of silyl ether 11a (200 mg, 616 µmol, 1.00 equiv.) in THF (1.23 mL) at -78 °C was dropped a solution of n-BuLi in hexanes (308 µL, 2.20 M, 1.10 equiv.) and the resulting mixture was stirred for 30 min, after which a solution of HMPA (441 mg, 2.46 mmol, 4.00 equiv.) in THF (1.23 mL) and Garner’s aldehyde 3 (169 mg, 739 mmol, 1.20 equiv.) in THF (1.48 mL) were added slowly at -78 °C. After stirring for 45 min at the same temperature, the mixture was allowed to warm to r.t. and stirred for further 3 h at r.t.. Addition of sat. NH₄Cl-solution was followed by CH₂Cl₂ extraction (3x). The combined organic phases were washed with brine, dried over MgSO₄, filtered and the volatiles removed in vacuo to yield the crude product which was purified via flash chromatography (cHex/EtOAc 100/0 to 50/50, eluting at 85/15) to yield a yellowish oil (242 mg), which was directly used in the next step.

To a solution of the alkyne (50.0 mg, 90.3 µmol) in THF (1.81 mL) at -10 °C was dropped a solution of Red-Al in toluene (63 µL, 3.6 M, 2.50 equiv.) with observable gas evolution. The mixture was warmed to 0 °C over 90 min after which saturated Na/K-tartrate solution was added. The mixture was extracted with TBME (3x) and the combined organic phases washed with brine, dried over MgSO₄ and the volatiles removed in vacuo to yield 12a as a colorless oil (49.9 mg, 70% over two steps).

General procedure 12 (GP12) for silyl deprotection

**Method A:** To a solution of the Silylether (1.00 equiv.) in THF (10 mL/mmol) was added TBAF (2.50 equiv, 1 M solution in THF) and the mixture stirred at r.t. until no starting material was observed on TLC. The mixture was diluted with MeOH and the volatiles were removed in vacuo to yield the crude product, which was purified by flash chromatography.

**Method B:** To a solution of the silylether (1.00 equiv.) in THF (20 mL/mmol) at 0°C were added pyridine (10.0 equiv.) and HF∙pyridine complex (40.0 equiv.) and the mixture was stirred at r.t. for 16 h. Addition of sat. NaCO₃-solution was followed by EtOAc-extraction. The combined organic phases were washed with brine, dried over MgSO₄, filtered and the volatiles removed in vacuo to yield the crude product which was purified by preparative RP-TLC (H₂O/MeCN 5/95).
