I General Information

All reactions were carried under Ar atmosphere unless otherwise noted. All chemicals were used without further purification as commercially available. Reactions were monitored by using thin-layer chromatography (TLC) on commercial silica gel plates (GF 254). Visualization of the developed plates was performed under UV lights (254 and 365 nm). Flash column chromatography was performed on silica gel (200-300 mesh). NMR (500 MHz or 400 MHz for $^1$H NMR, 125 MHz or 100 MHz for $^{13}$C NMR) spectra were recorded in CDCl$_3$ with TMS as the internal standard unless otherwise noted. Chemical shifts (δ) were reported in ppm referenced to the CDCl$_3$ residual peak (δ 7.28) for $^1$H NMR. Chemical shifts of $^{13}$C NMR were reported relative to CDCl$_3$ (δ 77.0). The following abbreviations were used to describe peak splitting patterns when appropriate: singlet (s), doublet (d), triplet (t), quartet (q), multiplet (m). Coupling constant, $J$, was reported in Hertz unit (Hz). High-resolution mass spectra (HRMS) analysis was measured using ESI techniques. The melting points were measured using X-4 melting point apparatus.

II Experimental Procedures

1. Synthesis of N-tosylbenzamides 1-5

A 100mL round-bottom flask was charged with benzoic acid (3 mmol), DCM (10 mL) and catalytic amount of DMF (two drops). The reaction mixture was cooled to 0 °C and stirred for 5 minutes. Then (COCl)$_2$ (3.6-9 mmol) was added dropwise to the reaction mixture and stirred for 3-12 h and monitored by TLC (petroleum ether/ethyl acetate 10:1. The resulting mixture was concentrated under reduced pressure to afford acid chloride which was used directly without any further purification for the next step.

A 25mL reaction tube under Ar was filled with $p$-toluene sulfonamide (1.0 eq), DMAP (0.5 mol %), ethyl acetate (2 mL/mmol) and triethylamide (2.5 eq). A solution of acid chloride (1.1 eq) in toluene (0.8 mL/mmol) was added dropwise to the reaction mixture and stirred for 3-12 h and monitored by TLC (petroleum ether/ethyl acetate 10:1. The resulting mixture was concentrated under reduced pressure to afford acid chloride which was used directly without any further purification for the next step.

2. Synthesis of N-methoxybenzamide 6

To a solution of K$_2$CO$_3$ (6.0 mmol, 2.0 equiv) in a mixture of EA/H2O (30 mL, 2:1) was added O-methylhydroxylamine hydrochloride (3.6 mmol, 1.2 equiv). The resulting solution was cooled to 0 °C, followed by dropwise addition of the benzoic chloride (3.0 mmol, 1.0 equiv). The reaction mixture was warmed to room temperature and stirred for overnight. The organic phase was separated and the aqueous phase was extracted with EtOAc (20 mL × 3). The combined organic layers were dried over
Na₂SO₄, filtered, and evaporated under reduced pressure. The pure products were obtained by flash column chromatography.

3. Synthesis of diazo compounds

A 100 mL round-bottomed flask was charged with acetylacetone (10 mmol) and acetonitrile (60 mL). p-Acetamidobenzene sulfonylazide (p-ABSA) (11-12 mmol) was added and the reaction was cooled to 0 °C. Trimethylamine (Et₃N) (30 mmol) was added dropwise and the reaction was warmed to room temperature for 1 h. and monitored by TLC. The resulting suspension was filtered through a fritted funnel and concentrated. The obtained residue was triturated with 1:1 ether:petroleum ether and the precipitated white solids were removed via filtration and evaporated. The residue was purified by passing through a pad of silica gel eluting with petroleum ether/ethyl acetate 2:1.

A mixture of iodobenzene (1.0 mmol), acetylacetone (3.0 mmol), CuI (10 mol%) and K₃PO₄·3H₂O (3.0 mmol) in DMSO (3 mL) was stirred in Ar at 90 °C. After completion of the reaction, it was monitored by TLC. And then, the mixture was quenched with diluted hydrochloride (2mL, 2M), the solution was extracted with ethyl acetate (3 times). The organic layers were combined, and dried over sodium sulfate. The pure product was obtained by flash column chromatography on silica gel eluting with petroleum ether/ethyl acetate 20:1.

And then, the product was dissolved in acetonitrile (2 mL/mmol) and P-ABSA (1.2 eq) was added. The solution was stirred at room temperature for 5 minutes and cooled to 0 °C. DBU (1.3 eq) was added dropwise and the mixture was stirred at room temperature for 3 h and monitored by TLC. The reaction was then quenched with 10 w% NaOH (aq), followed by extraction with EtO₂ (2 times). The combined organic layers were anhydrous sodium sulfate and concentrated under reduced pressure. The yellow crude product was purified by silica gel column chromatography eluting by petroleum ether/ethyl acetate 10:1 to afford product as yellow solid.
