**Experimental**

**General**

NMR spectra were recorded in CDCl$_3$ (ACROS ORGANICS, Chloroform-d for NMR, 0.03 v/v% TMS) with a Bruker AVANCE III 400 (400 MHz for $^1$H) spectrometer. The chemical shift values in the $^1$H and $^{13}$C NMR spectra are relative to TMS and CDCl$_3$, respectively, as an internal standard. The IR spectra were recorded on a FT/IR-460 Plus spectrometer. Electrospray ionization mass spectrometry (ESI-MS) was performed for samples dissolved into MeOH and THF with a Waters Synapt G2 HDMS tandem quadrupole orthogonal acceleration time-of-flight instrument. The eluent for GPC measurements was THF for tandem Shodex LF-404 columns. GPC was performed at 40°C, and UV (254 nm) and RI detectors were used. Polystyrene standards were used for GPC calibration. Gas chromatography was performed with a Shimadzu GC-21014 machine equipped with a Phenomenex Zebron ZB-5 capillary GC column (30m x 0.25 mm x 0.25 µm). A GC calibration was done by using toluene as an internal standard. Silica gel column chromatography was performed by using Kanto Chemical Silica Gel 60N (spherical, neutral). Acrylic acid (KANTO) and (4-t-butylphenyl)methanethiol (Sigma-Aldrich) were used as received. $S$-$n$-Dodecyl propanethioate was prepared from dodecane-1-thiol (KISHIDA, Japan) and propanoic acid (KANTO, Japan) with $N,N'$-dicyclohexylcarbodiimide (WAKO, Japan) by the same method as that used to prepare 1. Dry THF and CH$_2$Cl$_2$ were purchased from KANTO CHEMICAL CO. DMF (KISHIDA) was dried over CaH$_2$ (NACALAI TESQUE, Japan) and distilled. DBU (WAKO or KANTO), MTBD (TCI, Japan), TBD (Sigma-Aldrich), DMAP (KISHIDA), DABCO (WAKO) were distilled or recrystallized before use. $t$-BuOK (TCI), LiBr (KISHIDA), LiI (KISHIDA), LiPF$_6$ (WAKO), LiNTf$_2$ (KANTO), CsI (WAKO), CsNTf$_2$ (TCI), and phenothiazine (KONTO) were used as received.

**Isolation of side products 2 and 3**

According to the procedure mentioned for the polymerization of 1 (234 mg, 1 mmol), however, THF was employed as the solvent in place of DMF, and MTBD (5 mol% for 1) was used as the base. The reaction mixture was subjected to silica-gel column chromatography (CH$_2$Cl$_2$/hexane = 1/1 v/v) to isolate 2 ($R_f$=0.45, 21 mg) and 3 ($R_f$=0.4, 38 mg). $^1$H NMR spectra of 2 (CDCl$_3$, Fig. S9): δ 7.32 (m, 4H, aromatic), 7.20 (m, 4H, aromatic), 4.11 (s, 2H, (O=C)SC$_2$H$_4$), 3.69 (s, 2H, PhC$_2$H$_2$S), 2.76 (m, 4H, SC$_2$H$_4$(C=O)), 1.30 (s, 9H, C(CH$_3$)$_3$), 1.29 (s, 9H, C(CH$_3$)$_3$). $^1$H NMR of 3 (CDCl$_3$, Fig. S10): δ 7.24 (m, 4H, aromatic), 7.15 (m, 4H, aromatic), 6.05 (s, 1H, CH=), 5.54 (s, 1H, CH=), 4.07 (s, 2H, benzyl), 4.02 (s, 2H, benzyl), 2.67 (m, 4H, C$_2$H$_4$(C=O)), 1.22 (m, 18H, C(CH$_3$)$_3$).
Fig. S1 $^1$H NMR spectrum (CDCl$_3$) of $S$-(4-t-butylbenzyl) thioacrylate (1).

Fig. S2 $^{13}$C NMR spectrum (CDCl$_3$) of $S$-(4-t-butylbenzyl) thioacrylate (1).

X3 is assignable to the species formed by methanolysis of the thioester group of A3 during the ESI measurement; Calc. for X3 = A3 - 179.0895 + 31.0714 = 514.3267 (Found 514.2795).
