S1. Synthesis and characterization of TPPP derivatives

The nine TPPP derivatives were synthesized by using the known methods.¹⁻² The concrete steps are listed as follows: In a 100 mL round-bottom flask equipped with a reflux condenser and magnetic stir bar, aniline derivative (0.023 mol), benzaldehyde (2.4 g, 0.023 mol) and TsOH (0.40 g 0.0023 mol) were dissolved with 50 mL glacial acetic acid. The mixture was stirred at 90°C for 30 min. After that time, butane-2,3-dione (0.97 g, 0.0113 mol) was slowly added. Then the reaction mixture was stirred at 90°C for extra 3 h. The faint yellow precipitate of the obtained TPPP derivatives was collected by filtration. Further purification was occurred by recrystallization from CHCl₃ and drying in a vacuum oven to yield a yellowish powder. (Approximate yield: 11-14%)
