1. General Information

All reagents and solvents were purchased from TCI, Sigma-Aldrich, Alfa Aesar, Acros and Meryer. All reactions were conducted using standard Schlenk techniques. Column chromatography was performed using EM silica gel 60 (300-400 mesh). \(^1\)H NMR, \(^{13}\)C NMR and \(^{19}\)F NMR spectra were measured on a 500 MHz (or 400M) spectrometer, using DMSO-\(d_6\), CDCl\(_3\) or CD\(_3\)COD as the solvent with tetramethylsilane (TMS) as the internal standard at room temperature. Chemical shifts were reported in ppm. \(^1\)H NMR spectra were referenced to CDCl\(_3\) (7.26 ppm), DMSO-\(d_6\) (2.50 ppm) or CD\(_3\)COD (3.34 ppm), and \(^{13}\)C-NMR spectra were referenced to CDCl\(_3\) (77.0 ppm) or DMSO-\(d_6\) (39.5 ppm). Peak multiplicities were designated by the following abbreviations: s, singlet; d, doublet; t, triplet; m, multiplet. Chemical shifts are given in δ relative to TMS, the coupling constants \(J\) are given in Hz. Analysis of crude reaction mixture was done on the Varian 4000 GC/MS and Agilent 7890A/5975C. High-resolution mass spectra were recorded on a micrOTOF-Q II 10410 mass spectrometer.

Unless otherwise noted, all reagents and solvents were obtained commercially and used without further purification. The 2-Amino benzamide, \(^1\) 2-aminothiophenol\(^2\) and pyridin-2-ylmethanamine\(^3\) were prepared according to corresponding literature procedures.

2. Optimization of the reaction conditions

We began our investigation by combining a 1:2 mixture of pyridin-2-ylmethanamine (substrate 5a) and tertbutyl nitrite at room temperature in CH₃CN under N₂ atmosphere. To our delight, the desirable product 6a was isolated in 20% yield. We tested the effect of aprotic solvents on the yield. It was found that an improved yield was observed with dioxane (Table S1, entry 2), whereas only trace product was obtained with other aprotic solvents (Table S1, entries 3-9). Further screening of protic solvents showed that iPrOH, C₂H₅OH and CH₃OH resulted in insignificant amounts of the desired product 6a (Table S1, entries 11-13). Notably, the use of water as solvent provided only 10% yield product 6a, along with a large amount of unwanted hydrolysate (pyridin-2-ylmethanol) (Table S1, entry 10).

ᵇReaction condition: 5a (1 mmol), tBuONO (2 mmol), solvent (4 mL), temp., time, N₂. ᶦ1.5 equiv. of tBuONO was used. ᶜUnder air atmosphere.
Remarkably, the reaction employing benzyl alcohol as solvent delivered product in 80 % yield with complete conversion (Table S1, entry 14). Moreover, the attempt to use a smaller amount of tBuONO (1.5 eq) was successful, though slightly prolonging the reaction time was required (Table S1, entry 15). When the reaction was conducted under air atmosphere, a slight decrease in yield was observed (Table S1, entry 16). Raising the reaction temperature to 60 °C didn’t improve the yield (Table S1, entry 17).
3. General procedure for preparation of material

General procedure for preparation of 2-Amino benzamides

![Chemical structure]

2-Amino benzonitrile (1.04 g, 8.50 mmol) and potassium hydroxide (2.40 g, 42.5 mmol) were dissolved in hot ethanol (25 mL) and the reaction mixture refluxed for two hours. The resulting yellowish brown solution was allowed to cool to room temperature and the ethanol was removed in vacuo. The resulting brown solid was washed with water, saturated solution of NaHCO₃, and brine and extracted with ethyl acetate (50 mL x 3). The organic layer was evaporated in vacuo and the analytically pure product was obtained by recrystallization from ethanol.

General procedure for preparation of 2-aminothiophenols

![Chemical structure]

To the stirred solution of KOH (6 g) in 24 mL of water, benzothioazole (3 mmol) was added and refluxed for 17 h. The reaction mixture was then cooled to room temperature, and neutralized with 37.8 wt% hydrochloric acid. The reaction mixture was extracted with ethyl acetate, dried over Na₂SO₄, filtered and concentrated in vacuum. Purification of the crude product was achieved by flash column chromatography using petrol ether/ethyl acetate as eluent.
General procedure for preparation of pyridin-2-ylmethanamines

Hydroxylamine hydrochloride (750.5 mg, 10.8 mmol) and sodium acetate (NaOAc) (886 mg, 10.8 mmol) were heated at 60 °C in H₂O (10 mL) for 1 hour. To the above, ketone or aldehyde (1 g, 5.43 mmol) in 2 mL MeOH was then added. The resulting mixture was stirred at 60 °C overnight. The oxime solidified upon cooling the reaction mixture to room temperature. The product oxime was washed with MeOH and the solvent was dried under vacuum. The crude oxime, was used in the next step without further purification.

The above prepared oxime (1 g, 5 mmol), NH₄OAc (655 mg, 8.5 mmol), NH₃ (25% aqueous, 15 ml), EtOH (20 mL) and H₂O (10 ml) were mixed and heated at 80 °C. Activated Zn dust (1.47 g, 22.5 mmol) was then added to the reaction mixture in small amounts for over 30 mins. The resulting mixture was refluxed for 3 hour and then stirred at 25 °C overnight. The mixture was filtered and the residue was washed with MeOH and water. The filtrate was concentrated and the resulting aqueous solution was made strongly alkaline with 10 (M) NaOH solution. The amine was then extracted with ethyl acetate and the organic phase was then washed with brine, dried over Na₂SO₄ and concentrated under vacuum to afford product.
4. General experimental procedures

**General procedure for synthesis of 1,2,3-benzotriazine-4(3H)-ones**

![Chemical structure](image1)

To a stirred solution of the corresponding 1 (0.3 mmol) in CH₃CN (2 mL) was added dropwise tBuONO (0.45 mmol, 1.5 equiv.). After completion of addition, the mixture was stirred at room temperature until 1 disappeared, which was judged by TLC. The reaction solution was concentrated in vacuum, and the residue was chromatographed with petroleum and ethyl acetate as eluent to provide the corresponding product.

**General procedure for synthesis of 1,2,3-benzothiadiazoles**

![Chemical structure](image2)

To a stirred solution of the corresponding 3 (0.3 mmol) in CH₃CN (2 mL) was added dropwise tBuONO (0.45 mmol, 1.5 equiv.). After completion of addition, the mixture was stirred at room temperature until 3 disappeared, which was judged by TLC. The reaction solution was concentrated in vacuum, and the residue was chromatographed with petroleum and ethyl acetate as eluent to provide the corresponding product.

**General procedure for synthesis of triazolopyridines**

![Chemical structure](image3)
A Schlenk tube equipped with a stir bar was fitted with a rubber septum, and then it was evacuated and refilled with nitrogen three times. Under nitrogen, 5 (0.3 mmol, 1 equiv.), phenylmethanol (2 ml), tBuONO (0.45 mmol, 1.5 equiv.) were added in turn to the Schlenk tube through the rubber septum using syringes, and then the septum was replaced by a Teflon screwcap under nitrogen flow. The reaction mixture was stirred at room temperature until 5 disappeared, which was judged by TLC. The reaction solution was concentrated in vacuum, and the residue was chromatographed with petroleum and ethyl acetate as eluent to provide the corresponding product.
