**Experimental:**

**Reagents and instrumentation:**

All the chemicals were purchased from Sigma-Aldrich, Alfa Aesar and Merck Chemicals. Column chromatographic separations were performed using silica gel (100-200 mesh). Solvents were dried and distilled following standard procedures. TLC was carried out on pre-coated plates (Merck silica gel 60, f254), and the spots were visualized with UV light or by charring the plates dipped in 10% PMA solution in methanol or 5% H₂SO₄/vanillin/EtOH. ¹H NMR (300, 400 MHz) and ¹³C NMR (75, 100 MHz) spectra were recorded on a Bruker NMR spectrometer (d scale). UV-vis measurements were made using a Perkin Elmer UV-vis spectrophotometer (Model Lambda 25). Mass spectra (HRMS) had been recorded using Waters Mass Spectrometer (model XevoG2QToF). Mass analysis (LRMS) of compounds was determined by the applied Biosystems 4800 PLUS MALDI TOF/TOF analyser using TiO₂ as a matrix. To check reaction profiles Dionex ICS 3000 HPLC system was used with a semi-preparative BEH130 C18 (10 × 250 mm) column. Following gradient elution method was used: 50% A to 100 % B in 33 min; A = 0.1% TFA in CH₃CN/H₂O (5:95); B = 0.1 % TFA in CH₃CN / H₂O (1:1) with a flow rate of 2 mL/min. Whereas, for chiral molecules we used HyperClone 5µm BDS C18 130Å column (250 x 4.6 mm) and Lux 5µm i-Amylose-1 column (250 x 4.6 mm). Yield were determined by GC with area normalization; GC conditions: RTX-5 Column, 60 m × 0.32 mm, initial column temperature was increased from 130 to 250 °C at the rate of 7 °C/min; FID detector, 280 °C; Injector, 260 °C; Carrier Gas: N₂; Rate: 2.00 mL/min.

**1-(2-methoxyphenyl)-3-(o-tolyl)urea (2a):**

To a well stirred solution of o-toulidine (0.400 g, 3.73 mmol) in DCM (10 ml), 2-methoxyphenyl isocyanate (0.556 g, 3.73 mmol) was added and kept for stirring at room temperature for 10 min (checked by TLC). The solid thus obtained was filtered through a sintered funnel and partitioned between 5% NaHCO₃ and EtOAc for the removal of residual carbamaic acid. The organic portion was then dried over Na₂SO₄ and concentrated under reduced pressure. We obtained 2a as a white solid (0.957 g, 100%; m. p. 184±2 °C). For NMR quality sample we purified 0.070 g of it by column chromatography (30% EtOAc in hexane). ¹H-NMR in CDCl₃ + d₆-DMSO (300 MHz): δ 2.29 (s, 3H), 3.85 (s, 3H), 6.86-6.84 (m, 1ArH), 6.96-6.92 (m, 2ArH), 7.04-6.98 (m, 1ArH), 7.20-7.15 (m, 2ArH), 7.72-7.67 (m, 2ArH), 8.03 (bs, 1NH), 8.27-8.21 (m, 1NH). ¹³C-NMR in CDCl₃ + d₆-DMSO (75 MHz): δ 17.5, 54.9, 109.5, 118.4, 120.1, 120.9, 121.7, 122.4, 125.4, 127.9, 128.3, 129.4, 136.5, 147.2, 152.7.
