**General considerations.** The reagents used for experiments were commercially available and used as received unless otherwise noted. The instrument for electrolysis is dual display potentiostat (DJS-292B) (made in China). Cyclic voltammograms were obtained on a IVIUMSTAT potentiostat. Column chromatography was performed on silica gel 300-400 mesh. The yields reported are the isolated yields and the average of two runs. $^1$H and $^{13}$C NMR spectra of all compounds were recorded at 400 and 100 MHz with CDCl$_3$ as solvent respectively, except for $^1$H and $^{13}$C NMR spectra of compound 21a, 21b with d$_6$-DMSO as solvent. All coupling constants ($J$ values) were reported in Herz (Hz). HRMS were performed by Shanghai Mass Spectrometry Centre, Shanghai Institute of Organic Chemistry, CAS (Chinese Academic of Sciences).

**General procedure for metal-free electrocatalytic iodination of arylboronic acids**

**(A) Procedure A:** Arylboronic acid (0.2 mmol), NaI (0.24 mmol, 1.2 equiv) and CH$_3$OH/H$_2$O (6:4, 10 mL) were combined and added into oven-dried three-necked flask (25 mL) equipped with a stir bar. The flask was equipped with carbon plate (1.5 x 1.5 cm$^2$) as the anode and glassy carbon (d = 5 mm) as the cathode. The reaction mixture was stirred and electrolyzed at a constant current of 10 mA under 40 °C for 2 h. When the reaction was finished, the reaction mixture was diluted with EtOAc and filtered through a short plug of silica gel that was then washed with EtOAc. The combined organic phases were dried over anhydrous Na$_2$SO$_4$, filtered and concentrated in vacuo. The resulting residue was purified by flash chromatography on silica gel to provide corresponding product.

**(B) Procedure B:** Arylboronic acid (0.2 mmol), NaBr (0.24 mmol, 1.2 equiv), nBu$_4$NOAc (0.2 mmol, 1.0 equiv) and CH$_3$OH (10 mL) were combined and added into oven-dried three-necked flask (25 mL) equipped with a stir bar. The flask was equipped with carbon plate (1.5 x 1.5 cm$^2$) as the anode and glassy carbon (d = 5 mm) as the cathode. The reaction mixture was stirred and electrolyzed at a constant current of 10 mA under 40 °C for 4 h. When the reaction was finished, the reaction mixture was diluted with EtOAc and filtered through a short plug of silica gel that was then washed with EtOAc. The combined organic phases were concentrated in vacuo. The resulting residue was purified by flash chromatography on silica gel to provide corresponding product.
